CS182/282A: Designing, Visualizing and Understanding Deep Neural Networks

John Canny

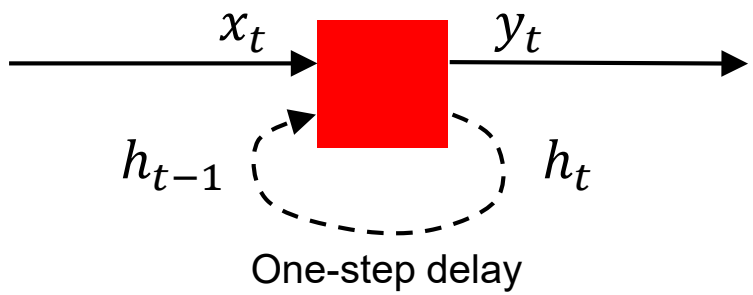
Spring 2020

Lecture 10: Visualization

Based on lecture by A. Karpathy

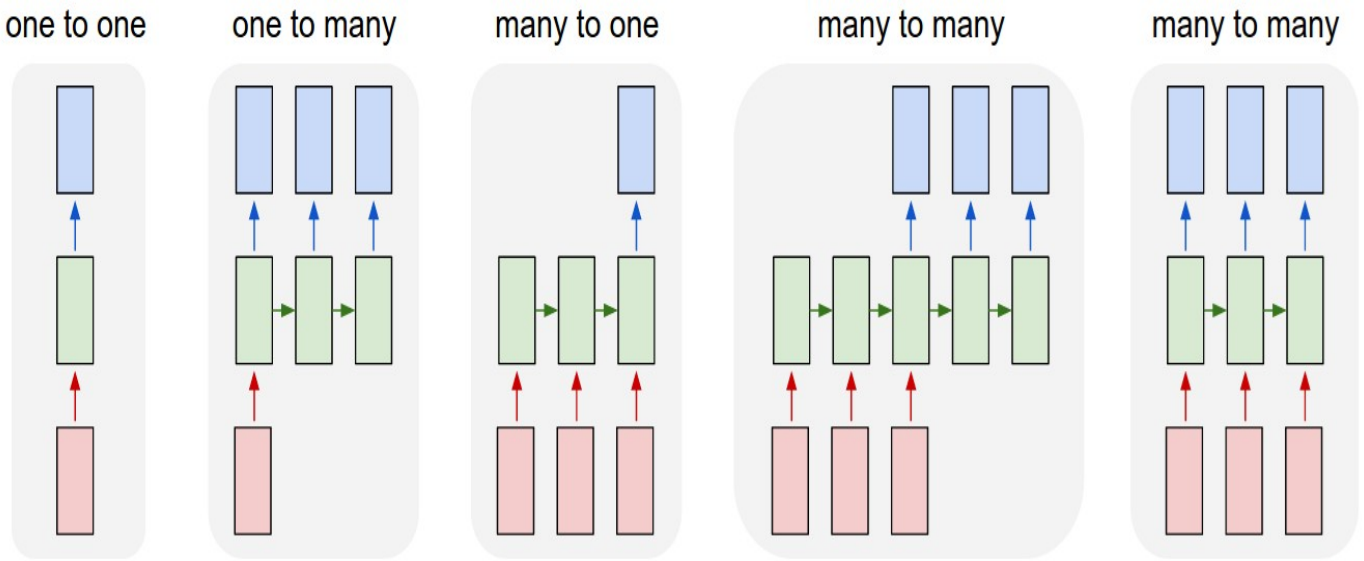
Last Time: Recurrent Neural Networks (RNNs)

Recurrent networks introduce cycles and a notion of time.

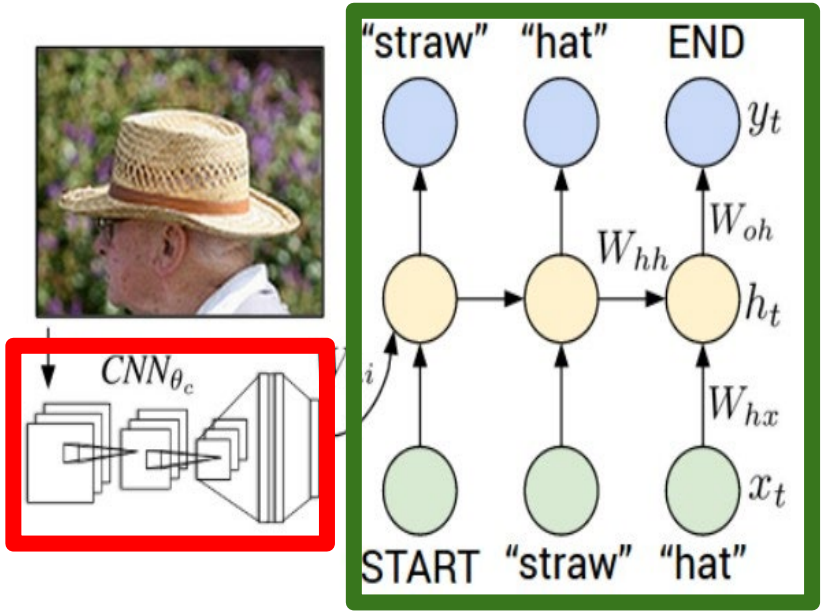


- They are designed to process sequences of data $x_1, \ldots, x_n$ and can produce sequences of outputs $y_1, \ldots, y_m$.

Last Time: Recurrent Designs:



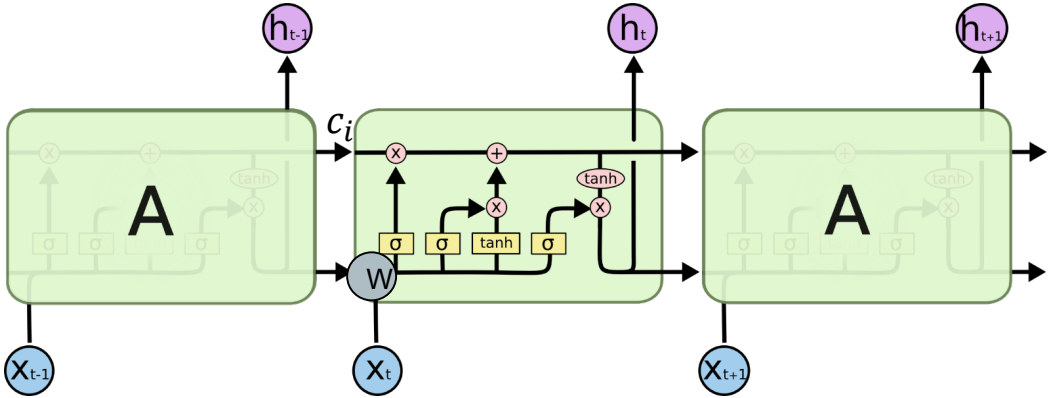
Last Time: Recurrent Neural Network Captioning



Convolutional Neural Network

Last Time: LSTMs

There are two recurrent nodes, c_i and h_i.
h_i plays the role of the output in the simple RNN, and is recurrent.
The the cell state c_i is the cell's *memory*, it undergoes no transform.
When we compose LSTMs into arrays, they look like this:



For stacked arrays, the hidden layers (h_i's) become the inputs (x_i's) for the layer above.

Figure courtesy Chris Olah http://colah.github.io/posts/2015-08-Understanding-LSTMs/

Last Time: Interpreting LSTM cells

```
#ifdef CONFIG_AUDITSYSCALL
static inline int audit_match_class_bits(int class, u32 *mask)
{
  int i;
  if (classes[class]) {
    for (i = 0; i < AUDIT_BITMASK_SIZE; i++)
      if (mask[i] & classes[class][i])
        return 0;
  }
  return 1;
}
```

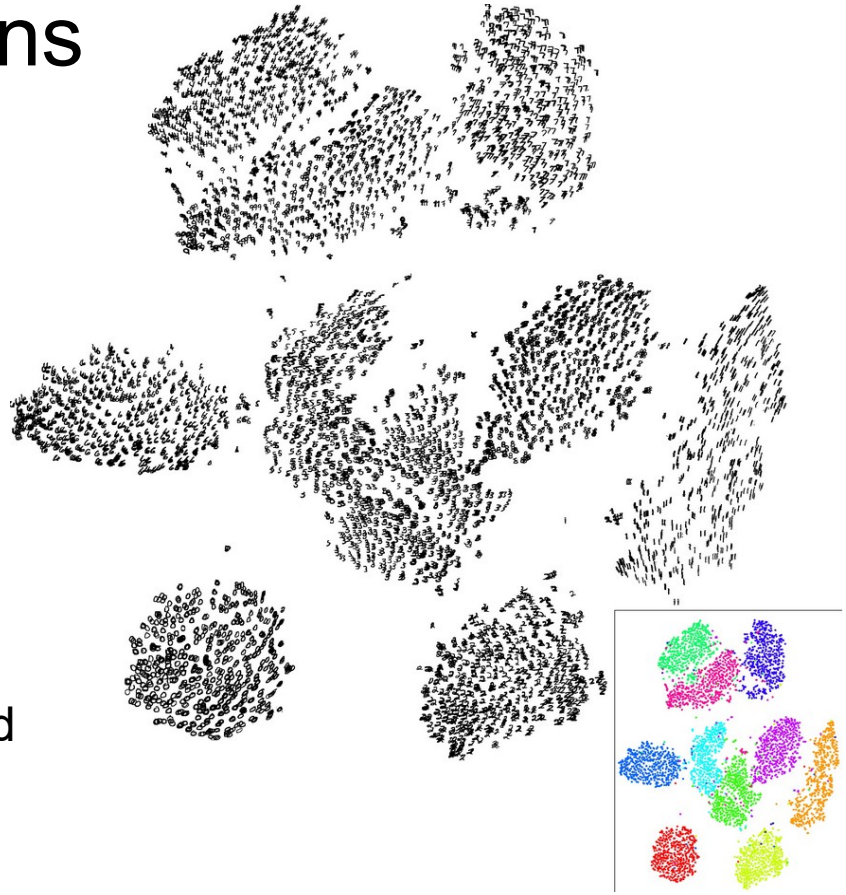
Monday 8-10pm in Pimentel Hall

Visualizing Representations

Neural network activations can be represented as points in high-dimensional space, one dimension per neuron.

But can we construct low-dimensional, i.e. 2D representations, that capture similar structure?

i.e. a projection down to 2D such that points that are close in ND are also close in 2D, and points that are far away in ND are far in 2D?



Visualizing Representations

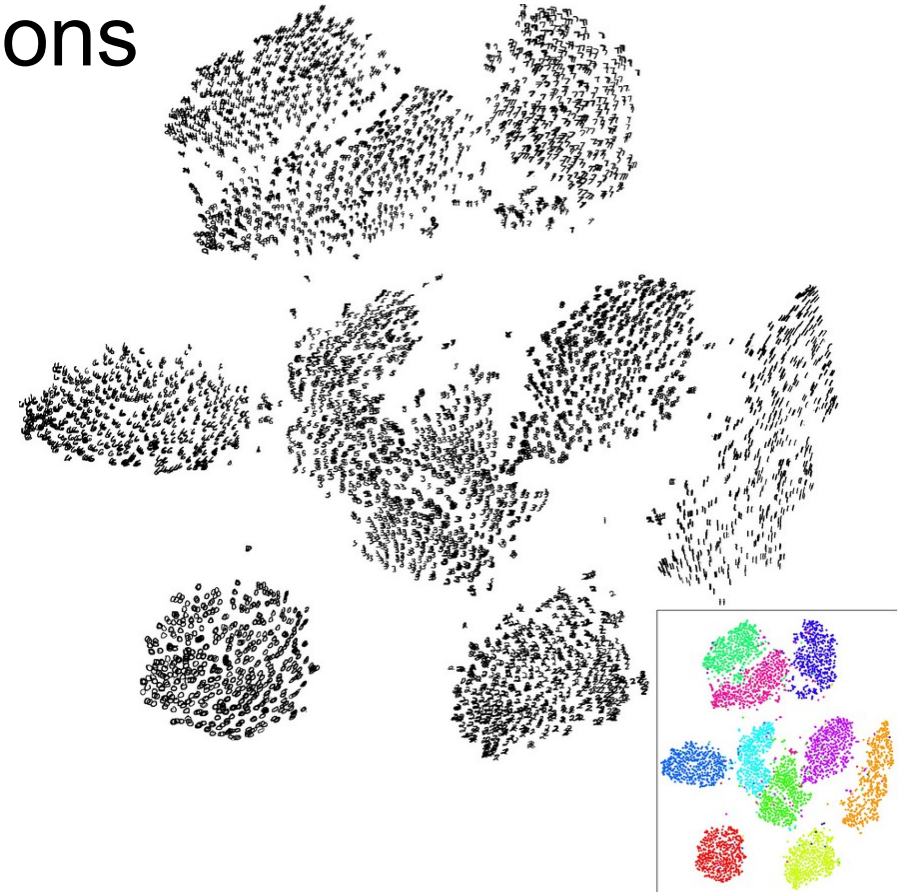
t-SNE visualization

[van der Maaten & Hinton]

Stochastic Neighbor Embedding:
Embed high-dimensional points so that locally, pairwise distances are conserved.

i.e. similar things end up in similar places.
dissimilar things end up wherever

Right: Example embedding of MNIST digit images (0-9) in 2D

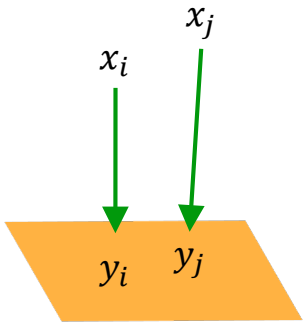


t-SNE visualization *[van der Maaten & Hinton]*

Idea: Define probability distributions over the high-dimensional (x_i) and low-dimensional (y_i) data points, then make these distributions as similar as possible.

"Neighbor probability" for x_i and x_j $$p_{j|i} = \frac{\exp\left(-||x_i - x_j||^2 / 2\sigma_i^2\right)}{\sum_{k \neq i} \exp\left(-||x_i - x_k||^2 / 2\sigma_i^2\right)}$$

"Neighbor probability" for y_i and y_j $$q_{j|i} = \frac{\exp\left(-||y_i - y_j||^2\right)}{\sum_{k \neq i} \exp\left(-||y_i - y_k||^2\right)}$$



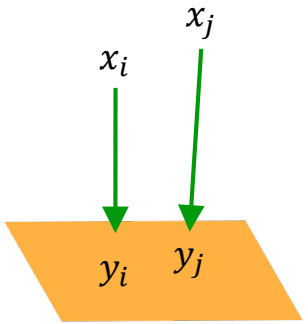
The probabilities are highest for points that are closest to each other.

The parameter σ_i is adjusted so that x_i has a reasonable number of neighbors, say 5 to 50.

t-SNE visualization *[van der Maaten & Hinton]*

"Neighbor probability" for x_i and x_j $$p_{j|i} = \frac{\exp(-||x_i - x_j||^2 / 2\sigma_i^2)}{\sum_{k \neq i} \exp(-||x_i - x_k||^2 / 2\sigma_i^2)}$$

"Neighbor probability" for y_i and y_j $$q_{j|i} = \frac{\exp(-||y_i - y_j||^2)}{\sum_{k \neq i} \exp(-||y_i - y_k||^2)}$$



Now minimize the KL-divergence between the probability distributions p and q by moving the points y_i.

$$C = D_{KL}(P||Q) = \sum_{i,j} p_{j|i} \log \frac{p_{j|i}}{q_{j|i}}$$

Compute the gradient of C with respect to the parameters y_i and optimize.

Review: KL-Divergence

For discrete distributions p and q, the KL-divergence is

$$D_{KL}(p||q) = \sum_i p_i \log \frac{p_i}{q_i}$$

The KL-Divergence satisfies:

A. symmetry, $D_{KL}(p||q) = D_{KL}(q||p)$

B. triangle inequality, $D_{KL}(p||r) \leq D_{KL}(p||q) + D_{KL}(q||r)$

C. $D_{KL}(p||q) = 0$ if and only if $p = q$ almost everywhere

D. all of the above

Oops!

For discrete distributions p and q, the KL-divergence is

$$D_{KL}(p||q) = \sum_i p_i \log \frac{p_i}{q_i}$$

The KL-Divergence satisfies:

A. symmetry, $D_{KL}(p||q) = D_{KL}(q||p)$

No, e.g. take $p = (0.5,0.5)$ and $q = (0.7,0.3)$.

$D_{KL}(p||q) = 0.0872$ while $D_{KL}(q||p) = 0.0823$

Try Again

Continue

Oops!

For discrete distributions p and q, the KL-divergence is

$$D_{KL}(p||q) = \sum_i p_i \log \frac{p_i}{q_i}$$

The KL-Divergence satisfies:

B. triangle inequality, $D_{KL}(p||r) \leq D_{KL}(p||q) + D_{KL}(q||r)$

No, e.g. take $p = (0.5,0.5)$, $q = (0.25,0.75)$, $r = (0.1,0.9)$

$D_{KL}(p||r) \approx 0.51$ while $D_{KL}(p||q) + D_{KL}(q||r) \approx 0.24$

Try Again

Continue

Yes!

For discrete distributions p and q, the KL-divergence is

$$D_{KL}(p||q) = \sum_i p_i \log \frac{p_i}{q_i}$$

The KL-Divergence satisfies:

C. $D_{KL}(p||q) = 0$ if and only if $p = q$ almost everywhere

It also satisfies $D_{KL}(p||q) \geq 0$ for all p and q.

Try Again

Continue

Oops!

For discrete distributions p and q, the KL-divergence is

$$D_{KL}(p||q) = \sum_i p_i \log \frac{p_i}{q_i}$$

The KL-Divergence satisfies:

D. all of the above

No, it fails A. and B.

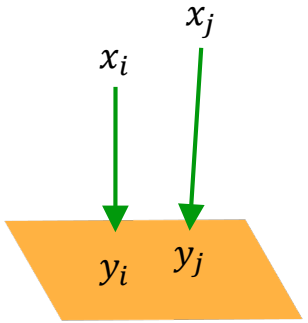
Try Again

Continue

t-SNE visualization *[van der Maaten & Hinton]*

"Neighbor probability" for x_i and x_j $$p_{j|i} = \frac{\exp(-||x_i - x_j||^2 / 2\sigma_i^2)}{\sum_{k \neq i} \exp(-||x_i - x_k||^2 / 2\sigma_i^2)}$$

"Neighbor probability" for y_i and y_j $$q_{j|i} = \frac{\exp(-||y_i - y_j||^2)}{\sum_{k \neq i} \exp(-||y_i - y_k||^2)}$$



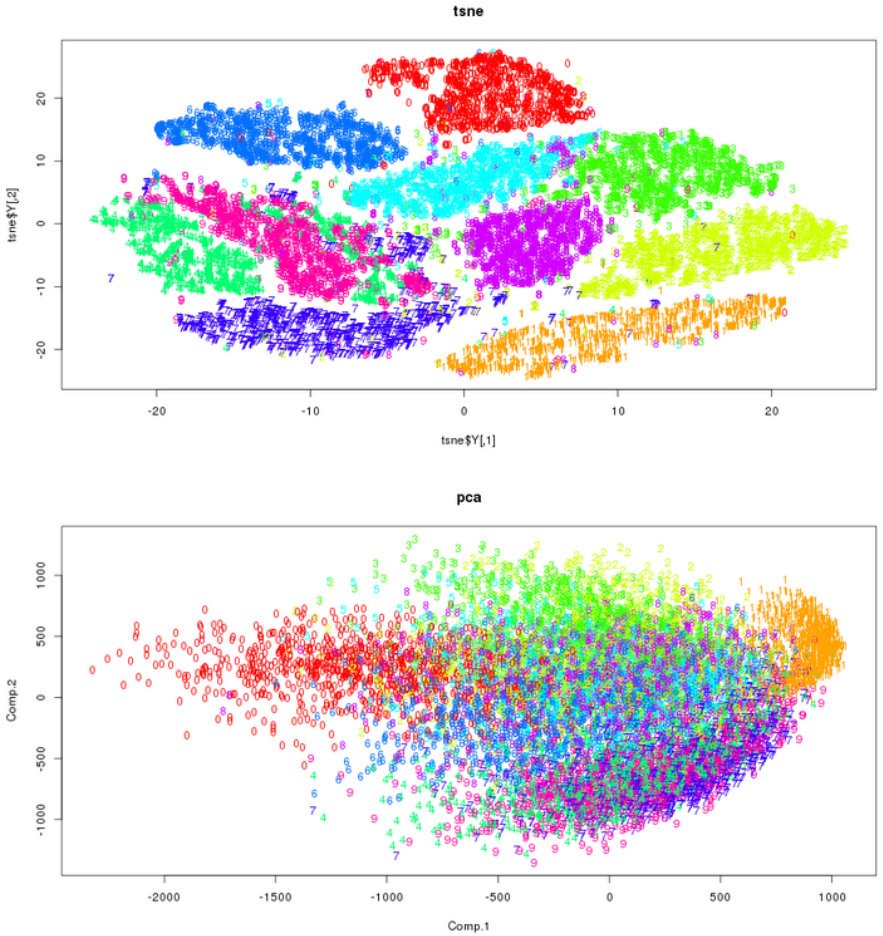
Now minimize the KL-divergence between the probability distributions p and q by moving the points y_i.

$$C = D_{KL}(P||Q) = \sum_{i,j} p_{j|i} \log \frac{p_{j|i}}{q_{j|i}}$$

Compute the gradient of C with respect to the parameters y_i and optimize.

t-SNE Embeddings

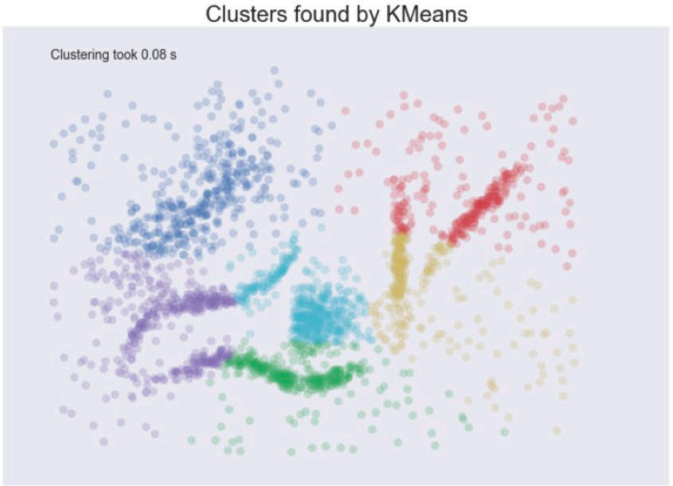
Generally does a better job of separating classes compared to PCA:

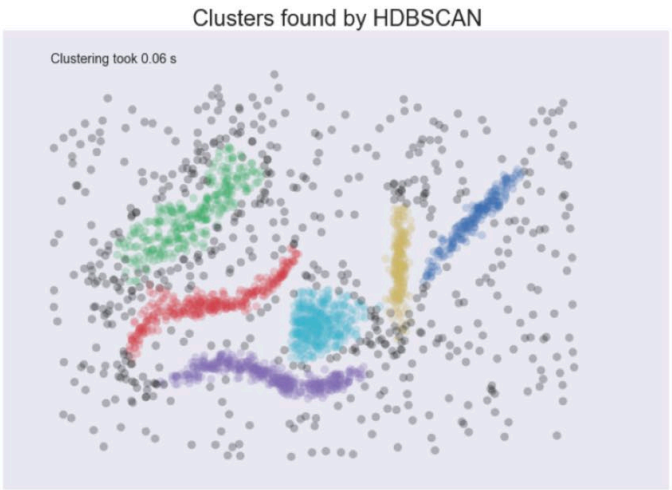


Clustering t-SNE data

A t-SNE embedding puts similar items close to each other in 2 or 3-D, but it doesn’t cluster the data which is often a useful step.

Since the clusters are not “compact” (sphere-like), its best to use a density-based clustering like DBSCAN or HDBSCAN



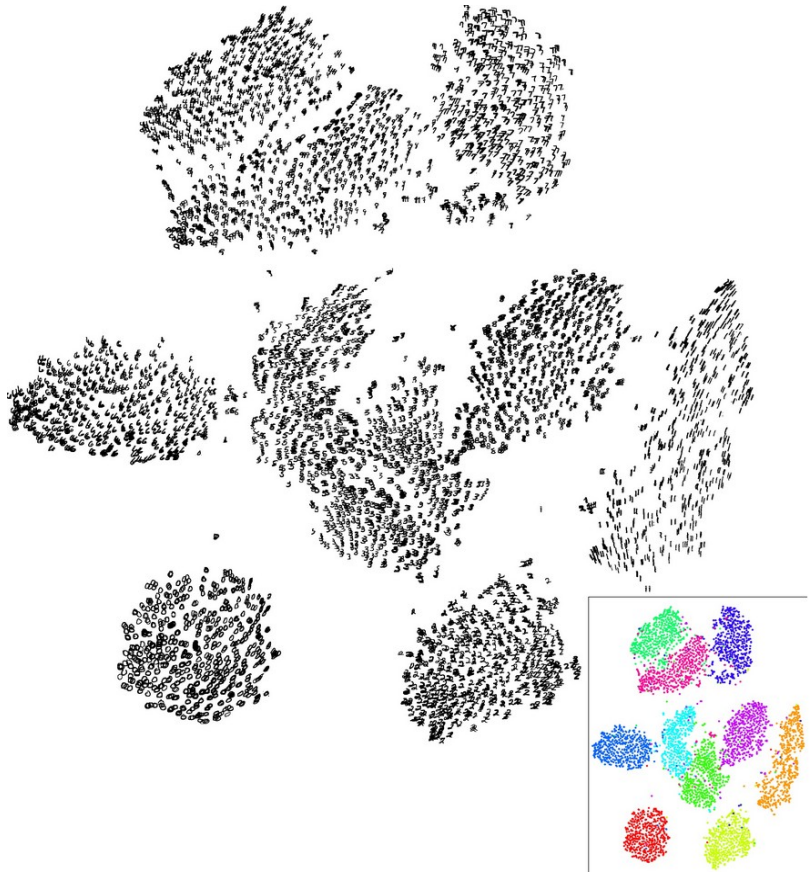


t-SNE implementation

Fast Stochastic Neighbor Embedding
[van der Maaten 2013]

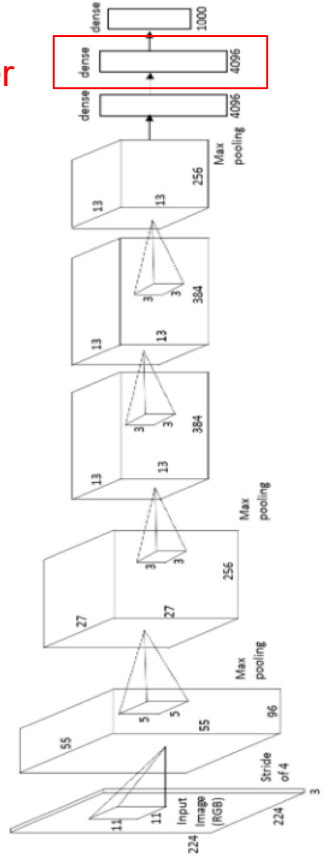
Aside: t-SNE is an iterative algorithm and expensive $O(N^2)$ for datasets with N points.

Its common to use an approximation (Barnes-Hut-SNE) which is $O(N \log N)$ and which can manage millions of points.



Visualizing CNN Representations

fc7 layer



4096-dimensional “code” for an image (layer immediately before the classifier)

can collect the code for many images

t-SNE visualization:

two images are placed nearby if their CNN codes are close. See more:

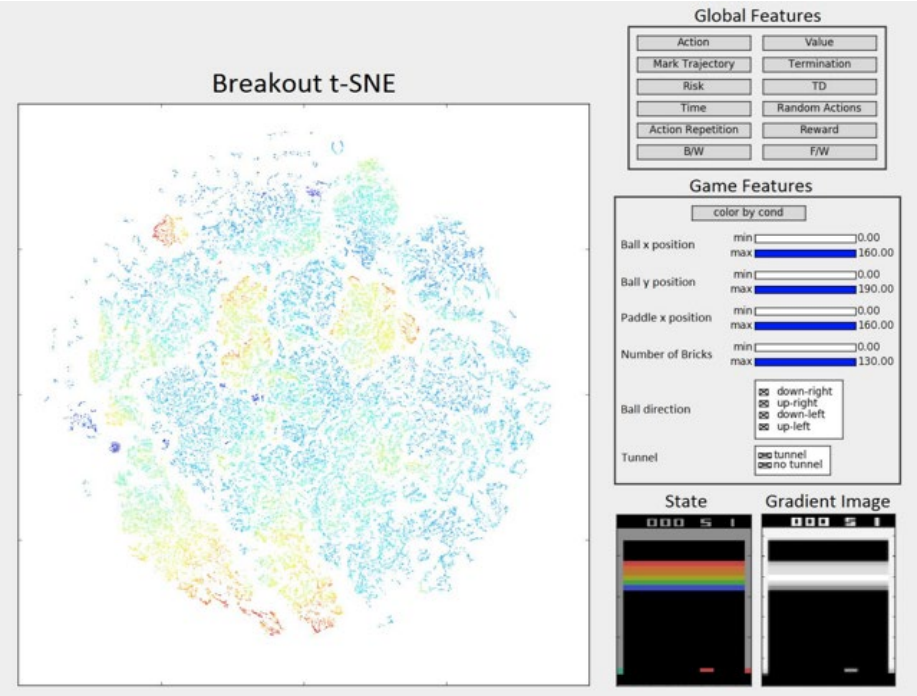
Graying the black box: Understanding DQNs

Zahavy, Zrihem, Mannor 2016

Playing Atari with Deep Reinforcement Learning, Mnih et al. 2013

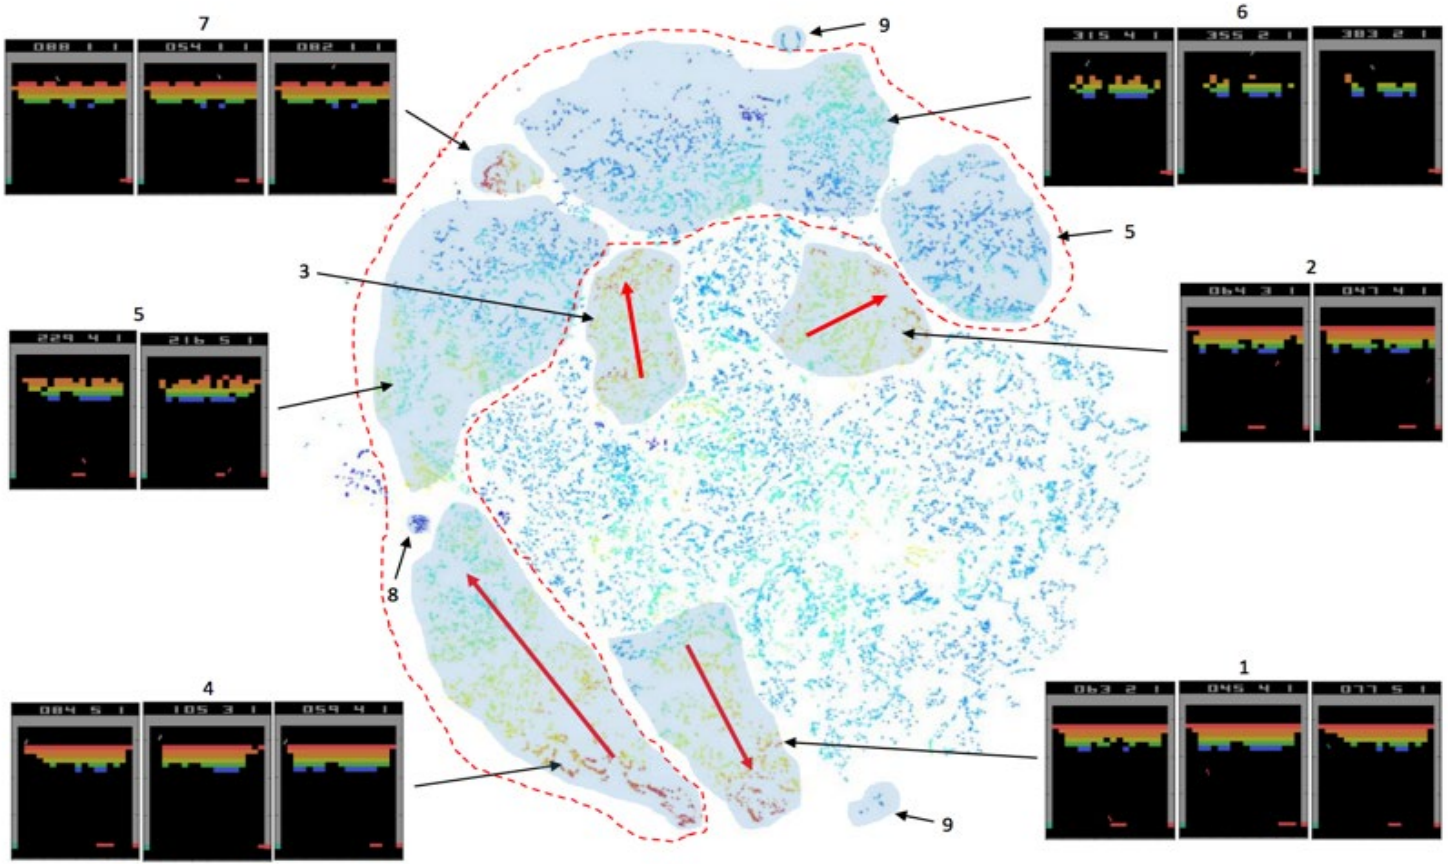
Graying the black box: Understanding DQNs

Zahavy, Zrihem, Mannor 2016



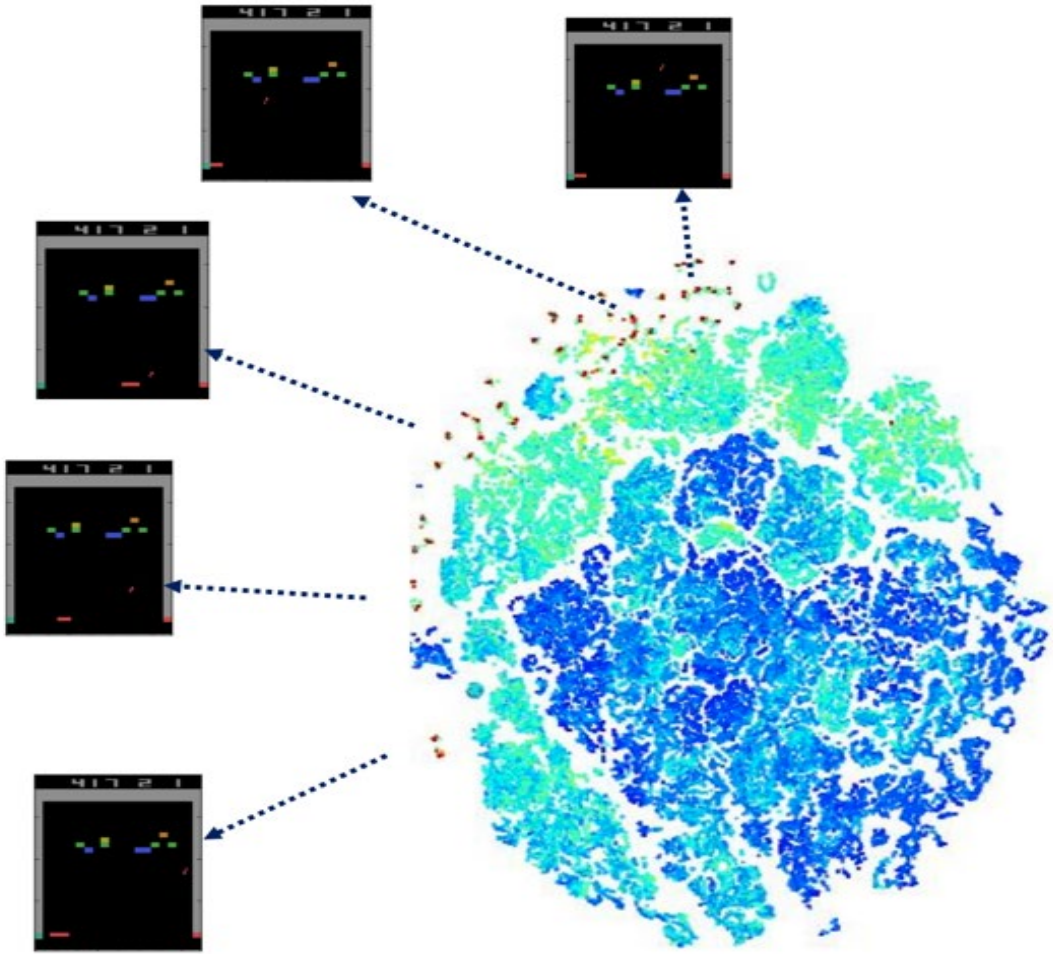
The embedding shows clustering of the *activations of the agent's policy network* for different frames of breakout.

Visualizing the network's "strategy"



Identify “policy bugs”: state clusters where the agent spends a very long time

(e.g. failing to hit the last few blocks over and over again for a very long time)



Understanding Learned CNN Models

What do ConvNets learn?

Multiple lines of attack:

- Visualize patches that maximally activate neurons
- Visualize the weights
- Visualize the representation space (e.g. with t-SNE)
- Occlusion experiments
- Deconv approaches (single backward pass)
- Optimization over image approaches (optimization)

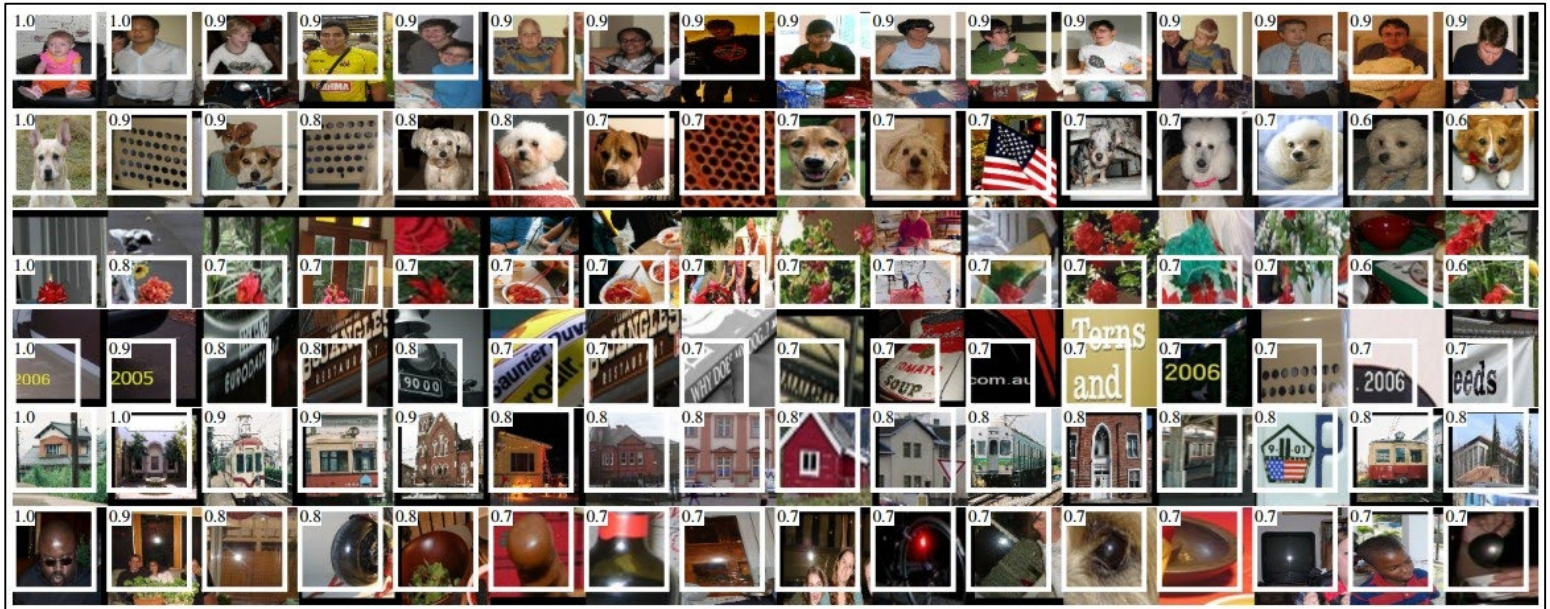


Figure 4: Top regions for six pool$_5$ units. Receptive fields and activation values are drawn in white. Some units are aligned to concepts, such as people (row 1) or text (4). Other units capture texture and material properties, such as dot arrays (2) and specular reflections (6).

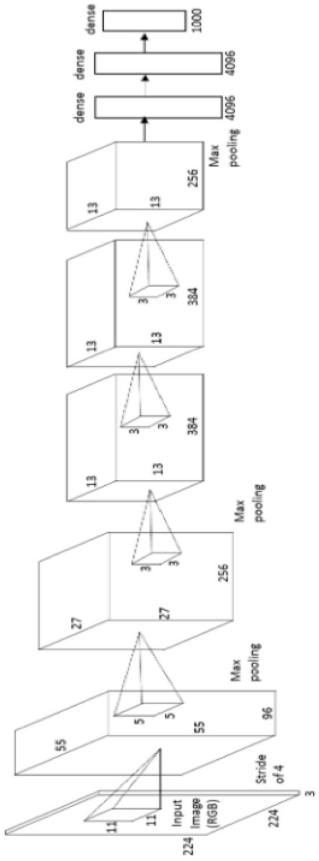
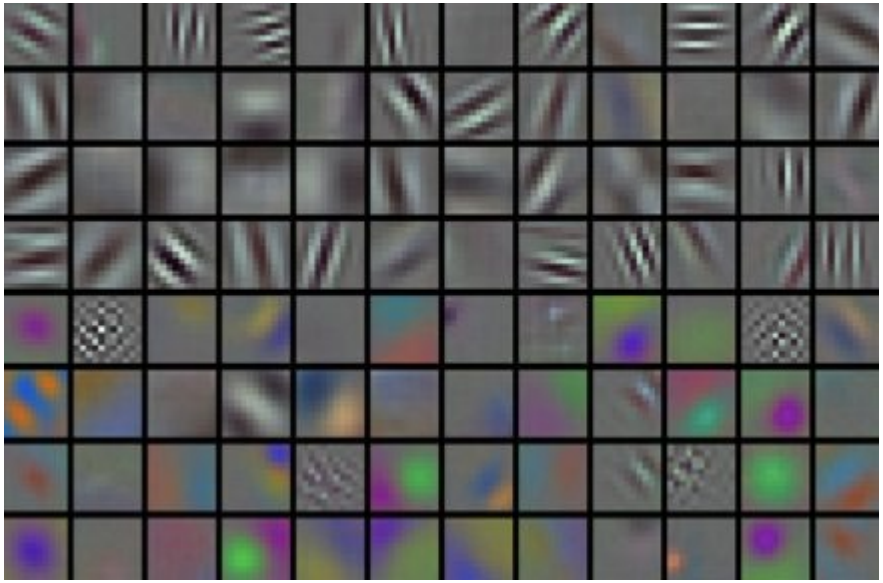
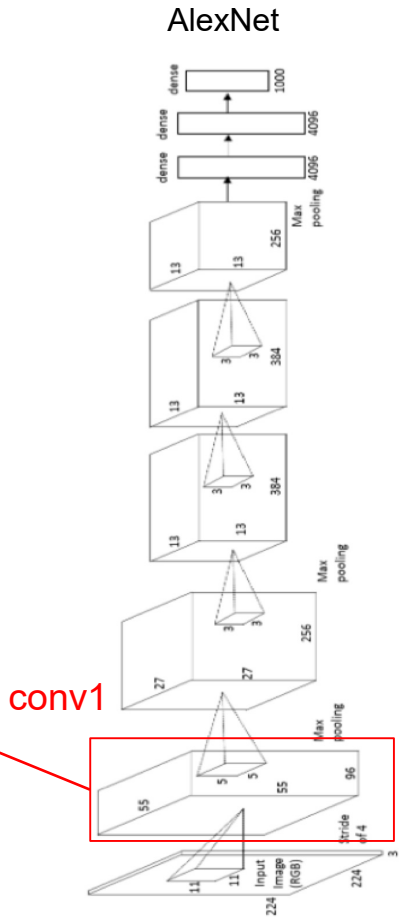
AlexNet



Rich feature hierarchies for accurate object detection and semantic segmentation – (R-CNN paper) [Girshick, Donahue, Darrell, Malik, 2014]

Visualize the filters/kernels (raw weights)





only interpretable on the first layer :(

Visualize the filters/kernels (raw weights)

you can still do it for higher layers, it's just not that interesting

(these are taken from ConvNetJS CIFAR-10 demo)

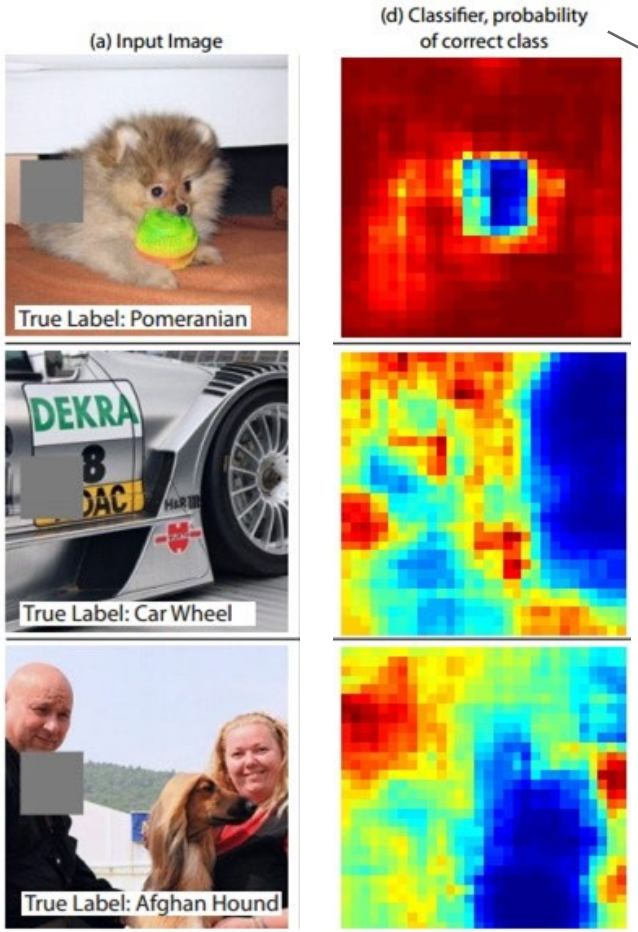
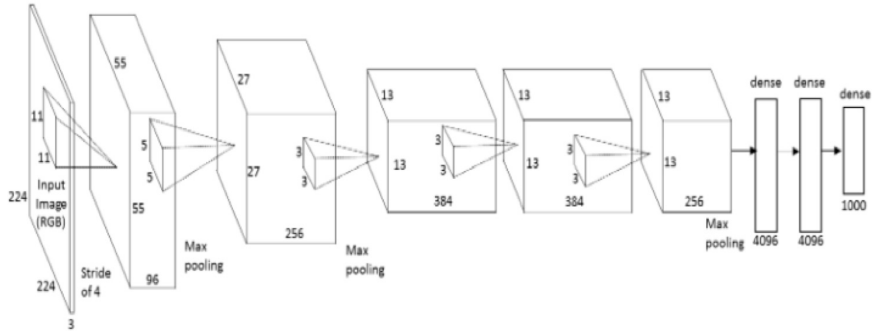
[Zeiler & Fergus 2013]



(as a function of the position of the gray square in the original image)

Saliency approaches (Network Centric)

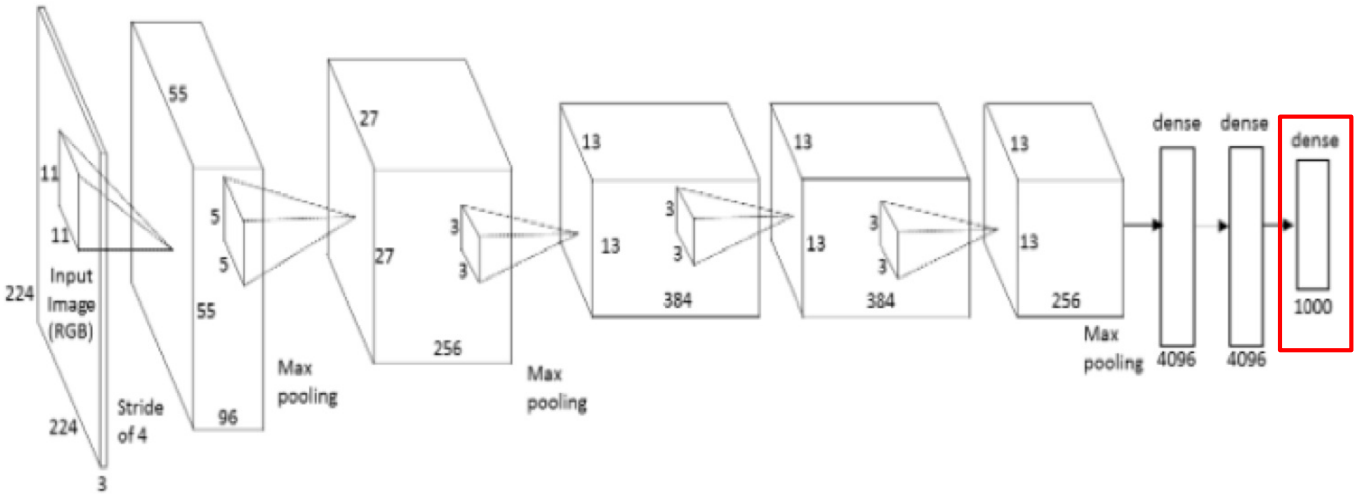
?



Q: how can we compute the pixels that have the most effect on the class score?

Deep Inside Convolutional Networks: Visualising Image Classification Models and Saliency Maps
Karen Simonyan, Andrea Vedaldi, Andrew Zisserman, 2014

Optimization to Image

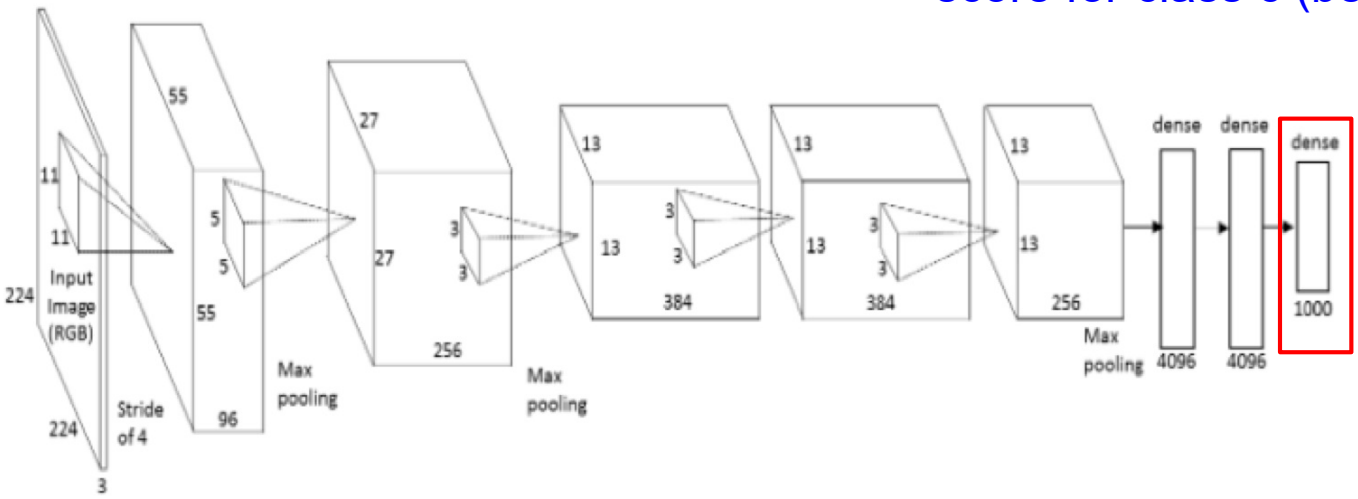


i.e. generate an image that maximizes the class score

Optimization to Image

$$\arg\max_I S_c(I) - \lambda \|I\|_2^2$$

score for class c (before Softmax)

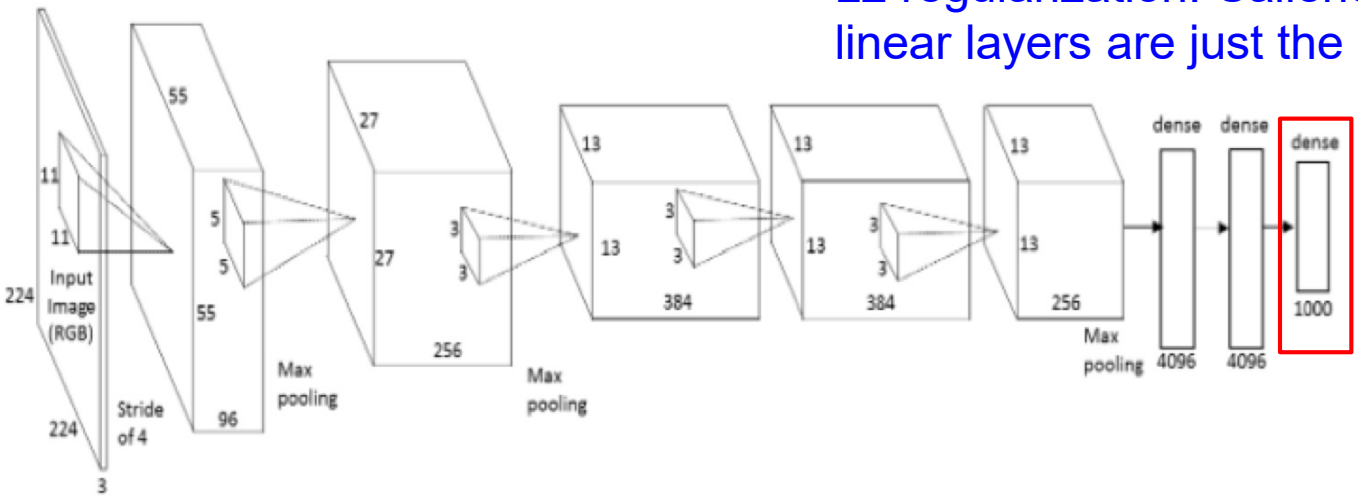


Generate an image that maximizes the class score

Optimization to Image

$$\arg\max_I S_c(I) - \lambda \|I\|_2^2$$

L2 regularization: Saliency maps for linear layers are just the layer weights.



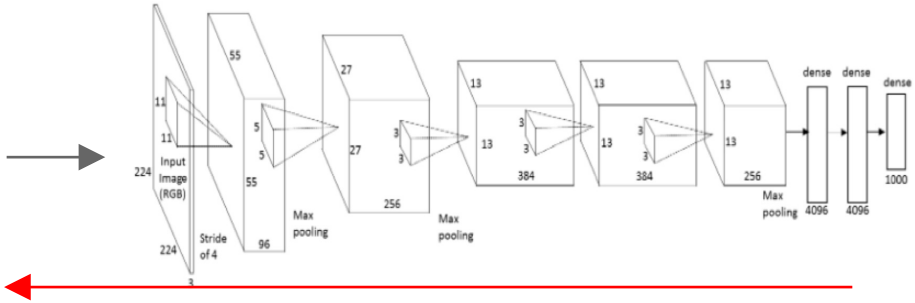
Generate image that maximizes some class score?

Deep Inside Convolutional Networks: Visualising Image Classification Models and Saliency Maps
Karen Simonyan, Andrea Vedaldi, Andrew Zisserman, 2014

Optimization to Image

1. feed in zeros.

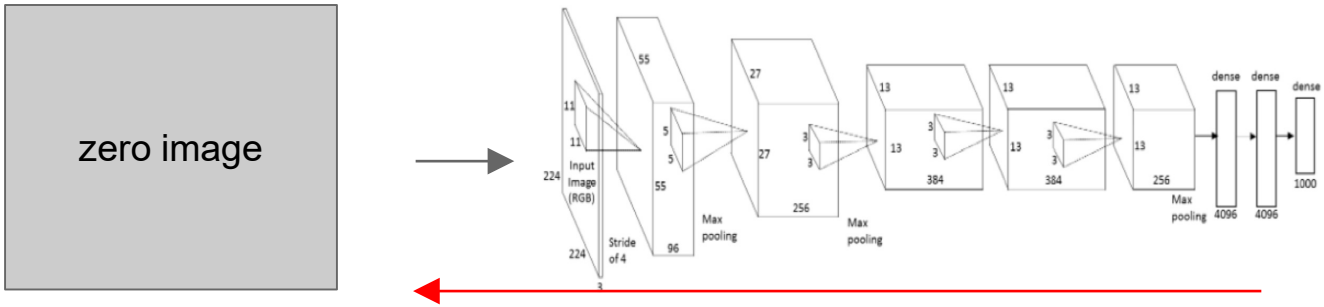
zero image



2. set the gradient of the scores vector to be [0,0,....1,.....,0], then backprop to image

Optimization to Image

1. feed in zeros.



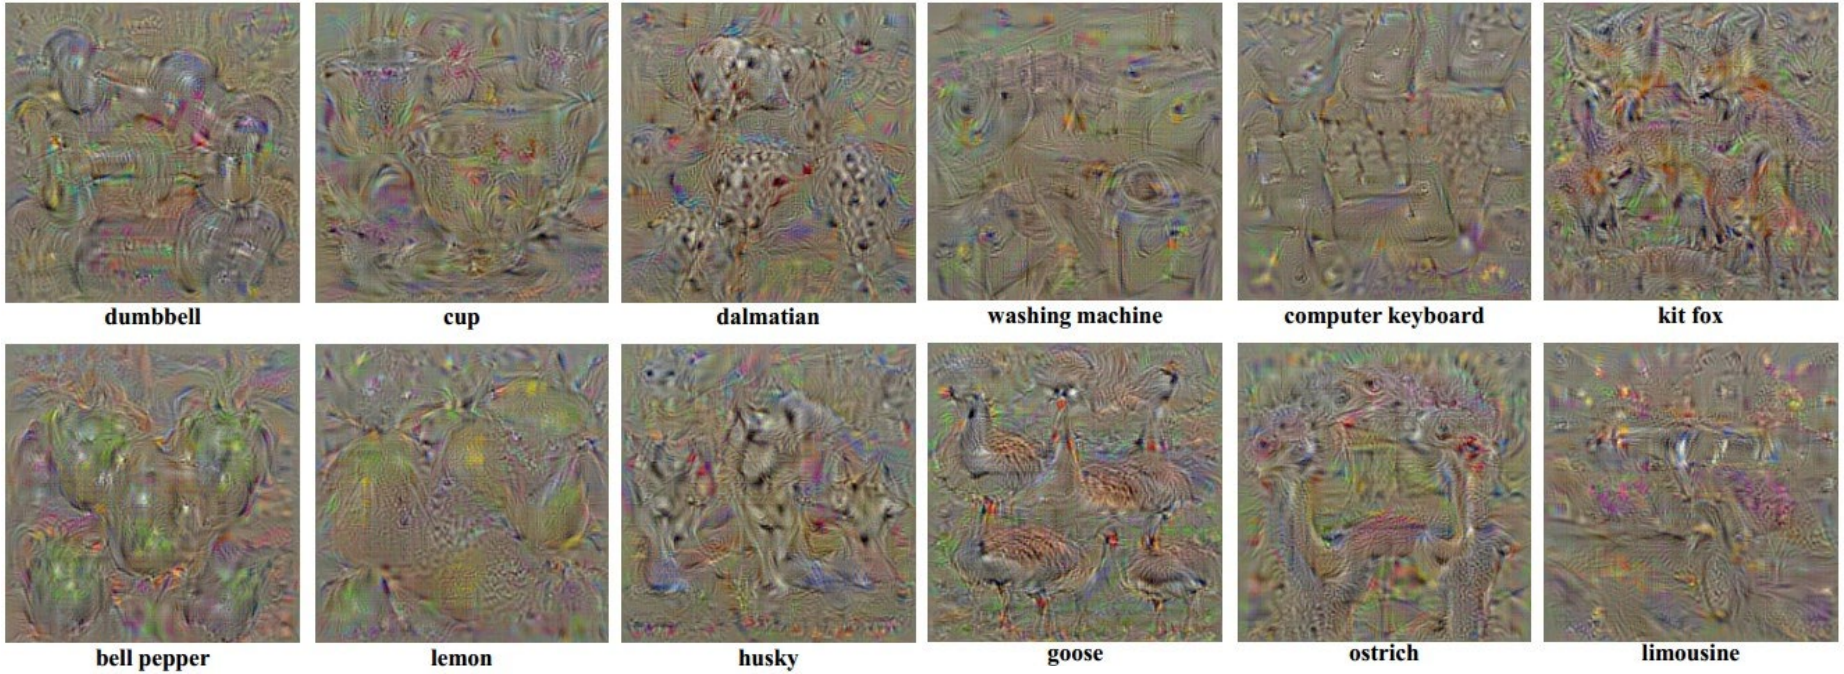
2. set the gradient of the scores vector to be [0,0,....1,.....,0], then backprop to image
3. do a small “image update”
4. forward the image through the network.
5. go back to 2.

$$\arg\max_I S_c(I) - \lambda \|I\|_2^2$$

score for class c (before Softmax)

Deep Inside Convolutional Networks: Visualising Image Classification Models and Saliency Maps
Karen Simonyan, Andrea Vedaldi, Andrew Zisserman, 2014

1. Generate images that maximize some class score:



Net is a slightly modified Alexnet

[Understanding Neural Networks Through Deep Visualization, Yosinski et al. , 2015]

Proposed 3 new regularizers beyond L_2

$$\arg\max_I S_c(I) - \lambda \|I\|_2^2$$

New Regularizers:

- Penalize high frequencies: Apply gaussian blur.
- Clip (zero) pixels with small norm using a threshold.
- Clip pixels with small contribution. Do this by ***ablation***: set pixel activation to zero, measure change in output. Zero pixels if change is small.

[Understanding Neural Networks Through Deep Visualization, Yosinski et al. , 2015] (AlexNet network)

http://yosinski.com/deepvis

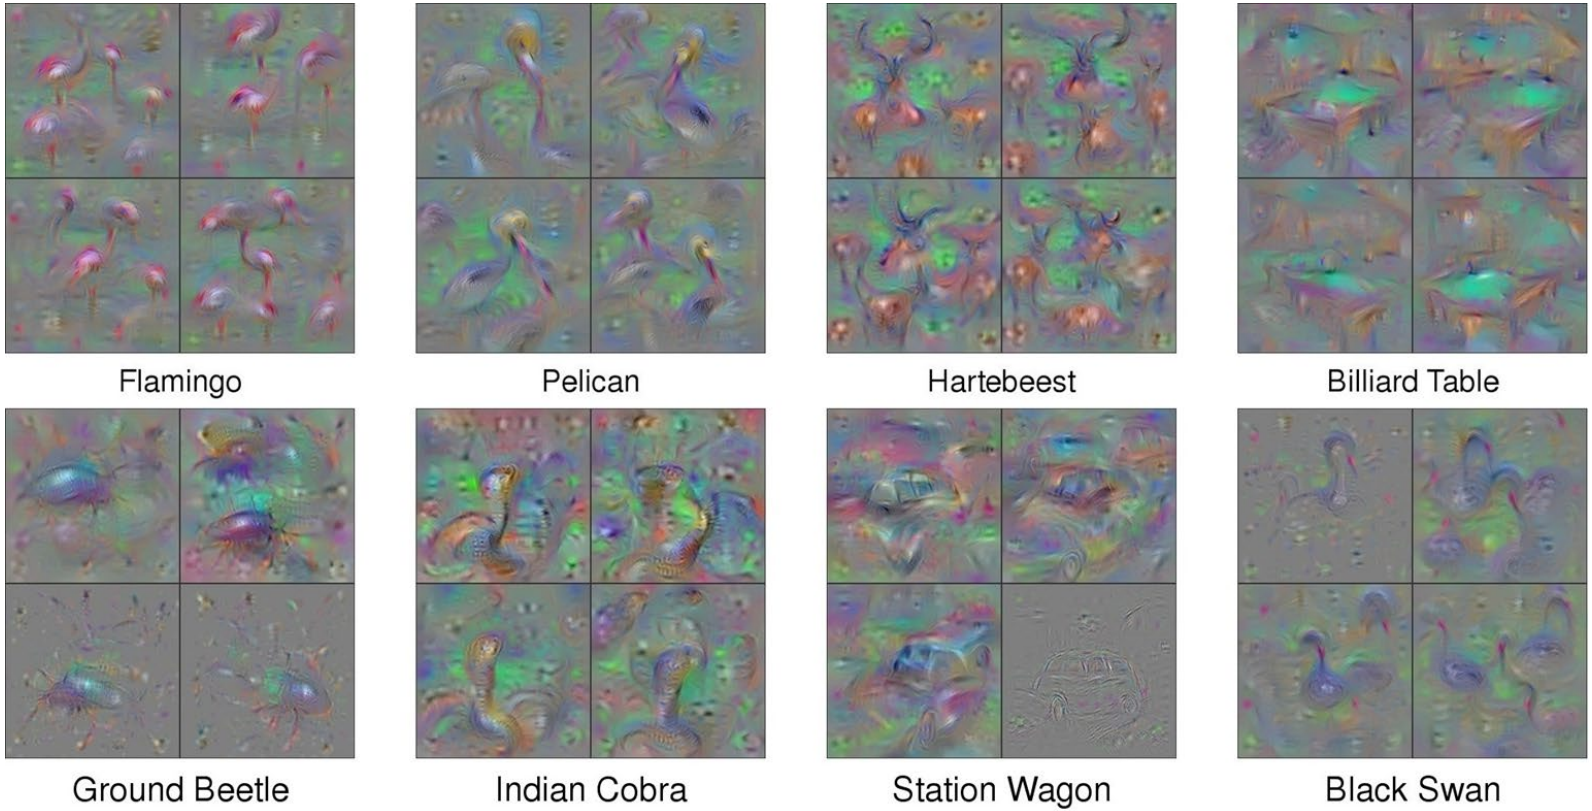


Image-Centric Approaches

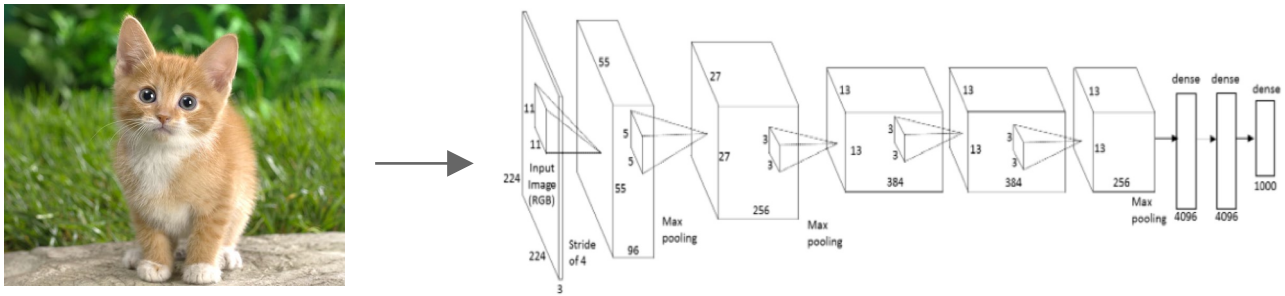
1. Feed image into net



Q: Which pixels are most important for the class output on a particular image?

Deep Inside Convolutional Networks: Visualising Image Classification Models and Saliency Maps
Karen Simonyan, Andrea Vedaldi, Andrew Zisserman, 2014

M = ?

2. Visualize the Data gradient:

(note that the gradient on data has three color channels. Here they visualize M, s.t.:

$$M_{ij} = \max_c |w_{h(i,j,c)}|$$

(at each pixel take abs val, and max over channels)

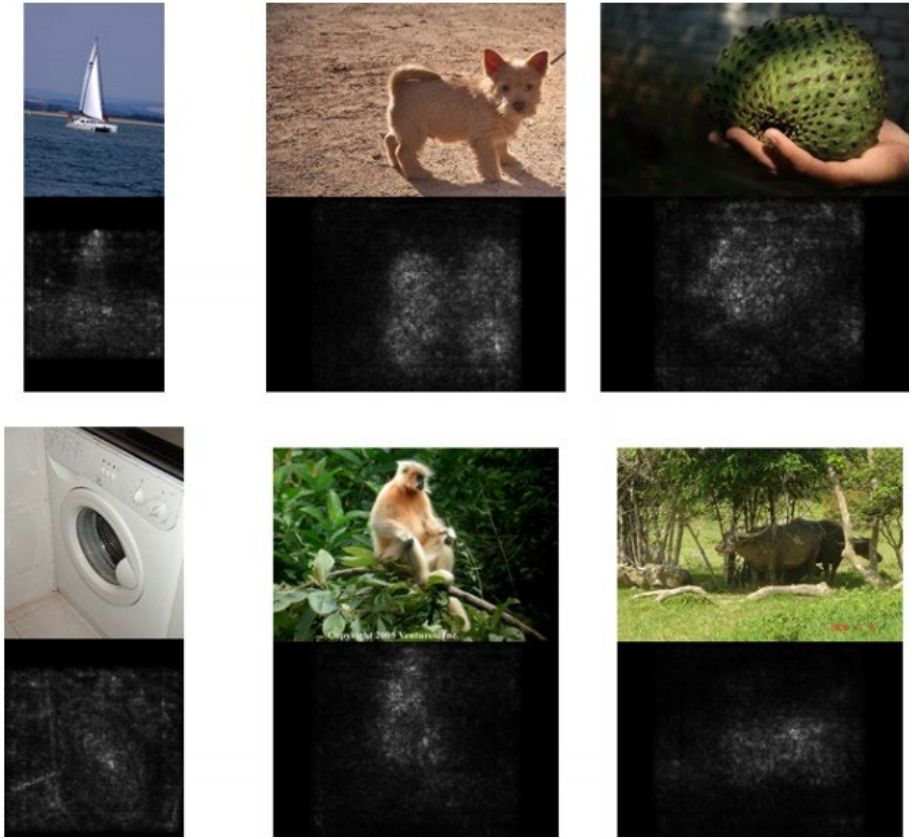
Deep Inside Convolutional Networks: Visualising Image Classification Models and Saliency Maps
Karen Simonyan, Andrea Vedaldi, Andrew Zisserman, 2014

2. Visualize the Data gradient:

(note that the gradient on data has three color channels. Here they visualize M, s.t.:

$$M_{ij} = \max_c |w_{h(i,j,c)}|$$

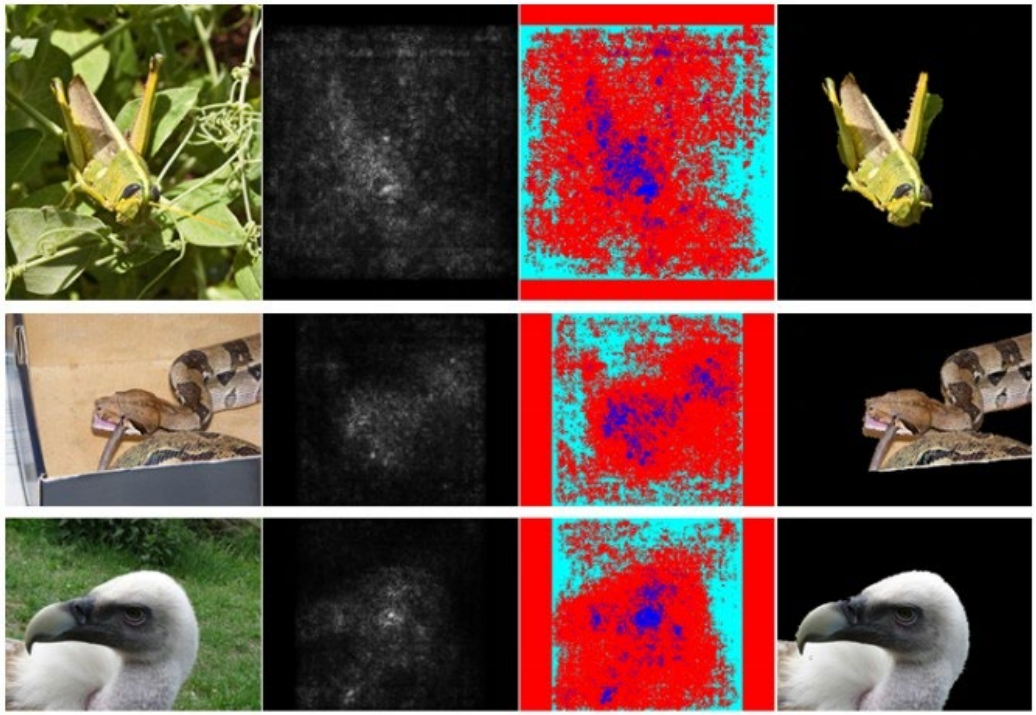
(at each pixel take abs val, and max over channels)



Deep Inside Convolutional Networks: Visualising Image Classification Models and Saliency Maps
Karen Simonyan, Andrea Vedaldi, Andrew Zisserman, 2014

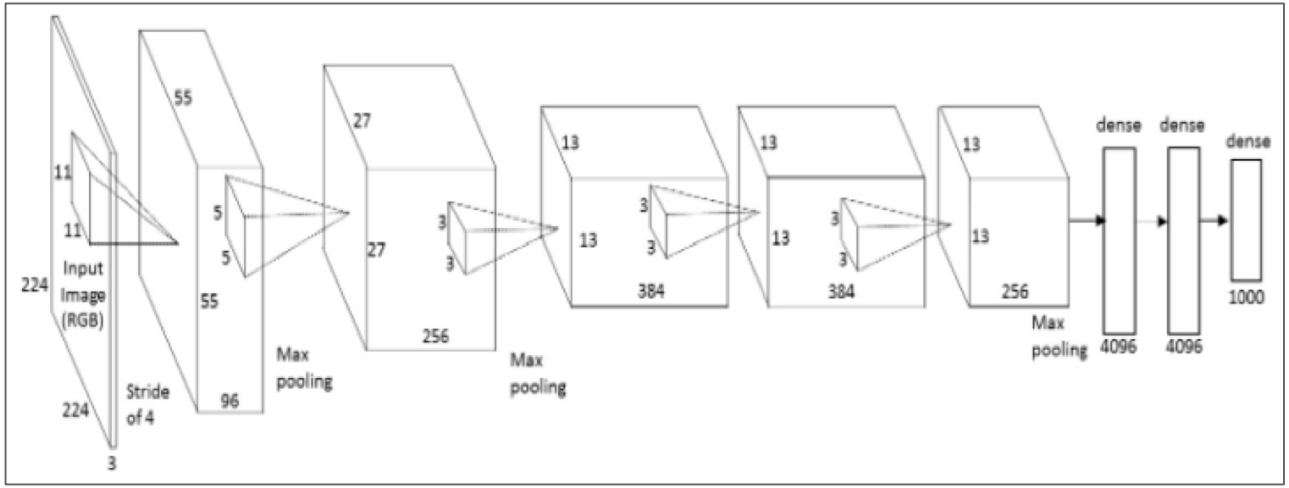
Use **graphcut** for segmentation:

- Use a box to select the object
- Compute the max class score
- Construct a saliency map for the class
- Segment the saliency map



Finds the activating object in the image

We can in fact do this for arbitrary neurons along the ConvNet

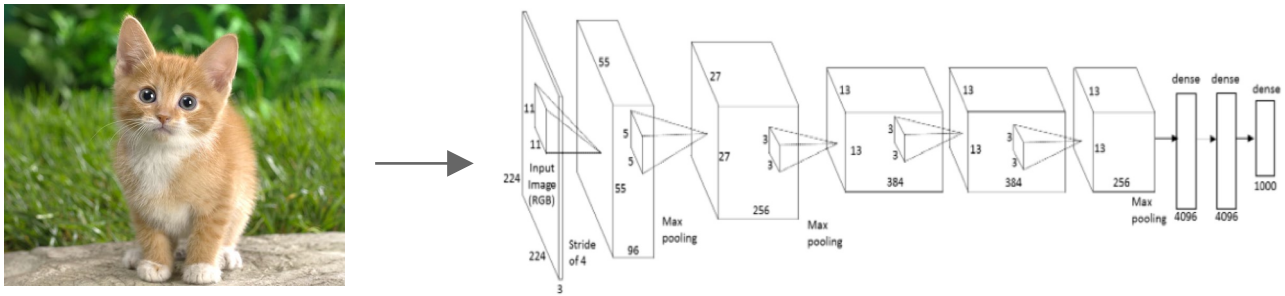


Repeat:

1. Forward an image
2. Set activations in layer of interest to all zero, except for a 1.0 for a neuron of interest
3. Backprop to image
4. Do an “image update”

Deconv approaches

1. Feed image into net



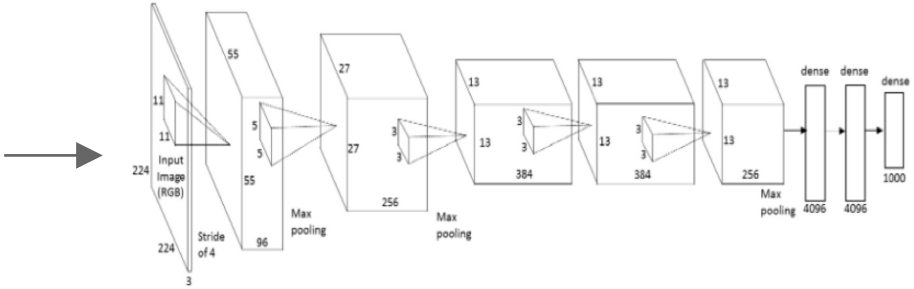
2. Propagate activations backwards using a “deconvnet”:

“A deconvnet can be thought of as a convnet model that uses the same components (filtering, pooling) but in reverse, so instead of mapping pixels to features does the opposite”

[Visualizing and Understanding Convolutional Networks, Zeiler and Fergus 2013]

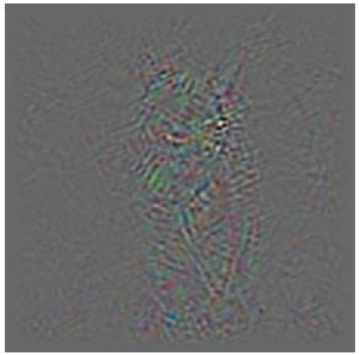
Deconv approaches

1. Feed image into net



2. Pick a layer, start from a given neuron, and propagate backwards:

3. Deconv:



“Guided backpropagation:” instead

Deconv/Guided Backprop Intuition

Neurons can have either *excitatory* or *inhibitory* inputs.

Excitatory inputs have positive influence on the output (positive gradient) while inhibitory inputs have negative influence (negative gradient).

e.g. for a Cat class, these features have positive influence:

- Round eyes, pointed ears, fur,…

While these have negative:

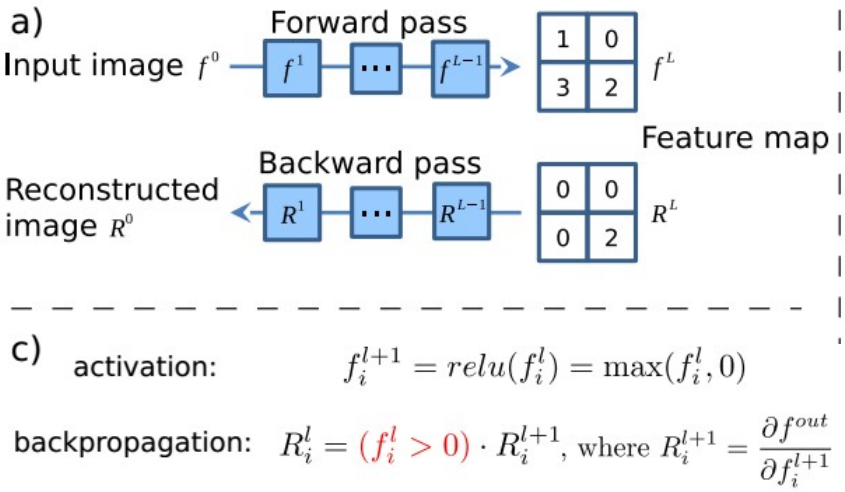
- Scales, fins, leaves,…

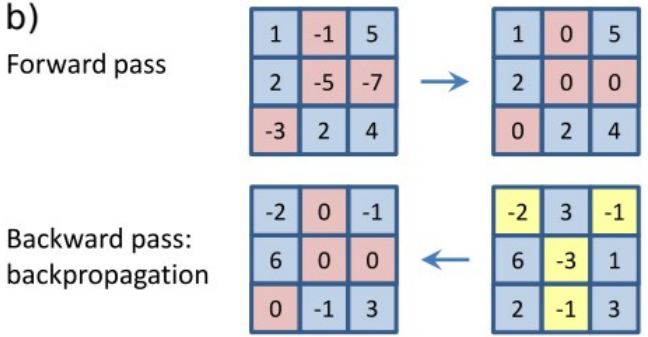
For visualizing the cat class, the excitatory inputs are more useful.

Deconv/guided backprop methods remove inhibitory inputs (negative gradient inputs).

Deconv approaches

[Visualizing and Understanding Convolutional Networks, Zeiler and Fergus 2013]
[Striving for Simplicity: The all convolutional net, Springenberg, Dosovitskiy, et al., 2015]

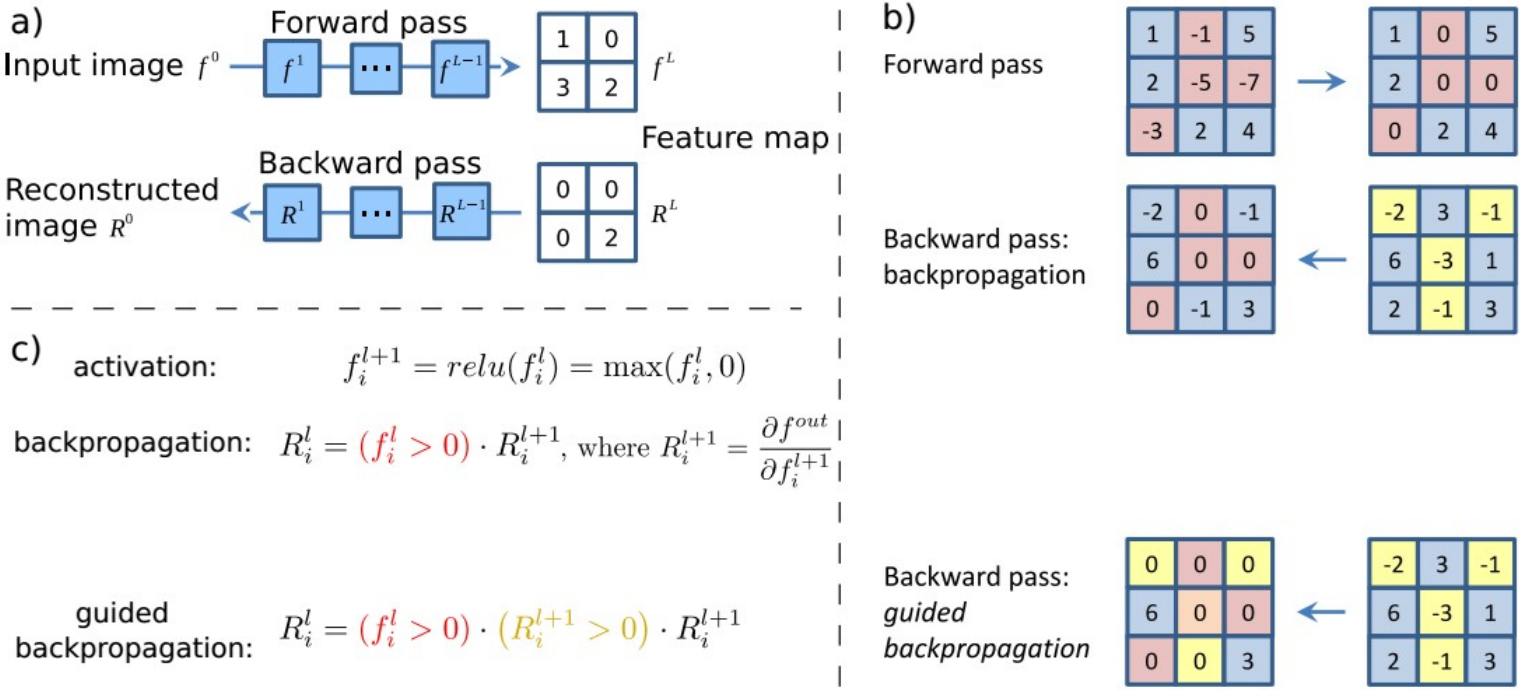




Backward pass for a ReLU (will be changed in Guided Backprop)

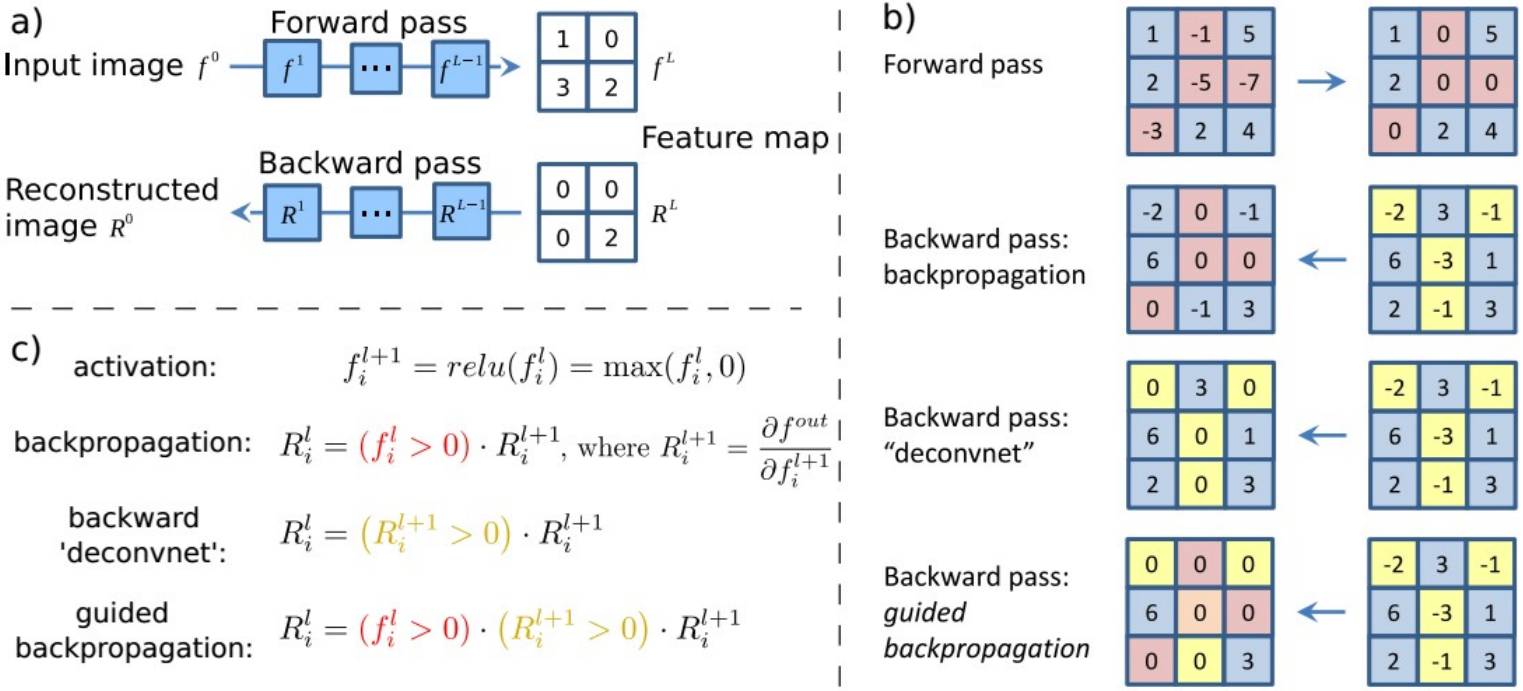
Deconv approaches

[Visualizing and Understanding Convolutional Networks, Zeiler and Fergus 2013]
[Striving for Simplicity: The all convolutional net, Springenberg, Dosovitskiy, et al., 2015]



Deconv approaches

[Visualizing and Understanding Convolutional Networks, Zeiler and Fergus 2013]
[Striving for Simplicity: The all convolutional net, Springenberg, Dosovitskiy, et al., 2015]

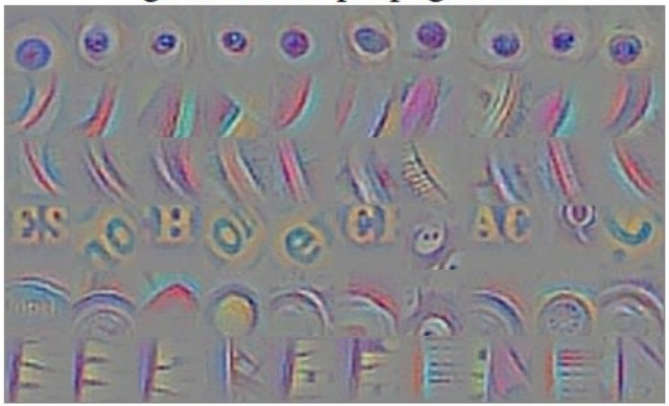


Visualization of patterns learned by the layer **conv6** (top) and layer **conv9** (bottom) of the network trained on ImageNet.

Each row corresponds to one filter.

The visualization using “guided backpropagation” is based on the top 10 image patches activating this filter taken from the ImageNet dataset.

guided backpropagation



corresponding image crops

guided backpropagation

corresponding image crops

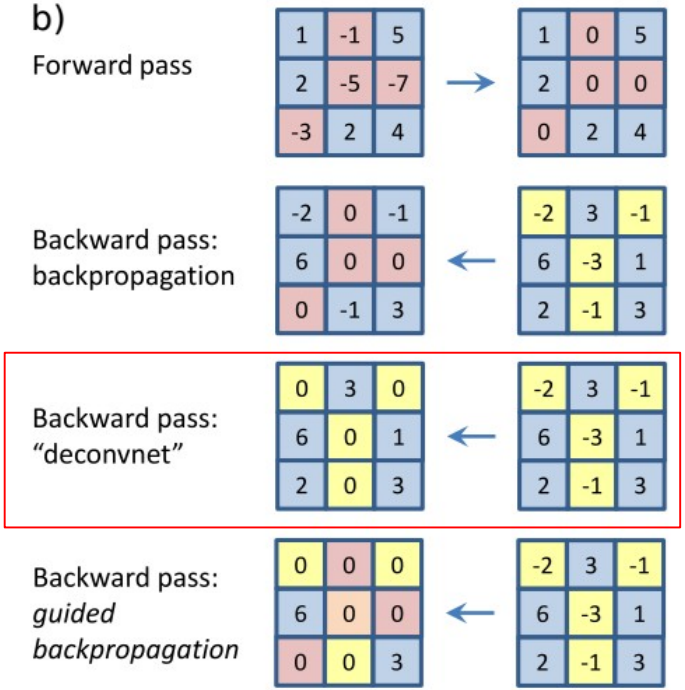
c)

activation: $f_i^{l+1} = relu(f_i^l) = \max(f_i^l, 0)$

backpropagation: $R_i^l = (f_i^l > 0) \cdot R_i^{l+1}$, where $R_i^{l+1} = \frac{\partial f^{out}}{\partial f_i^{l+1}}$

backward 'deconvnet': $R_i^l = (R_i^{l+1} > 0) \cdot R_i^{l+1}$

guided backpropagation: $R_i^l = (f_i^l > 0) \cdot (R_i^{l+1} > 0) \cdot R_i^{l+1}$



Intuition: Feature maps shouldn't be conditioned on images

Visualizing arbitrary neurons along the way to the top...

Improving Diversity

[Nguyen et al 2016 Multifaceted Feature Visualization: Uncovering the Different Types of Features Learned By Each Neuron in Deep Neural Networks]

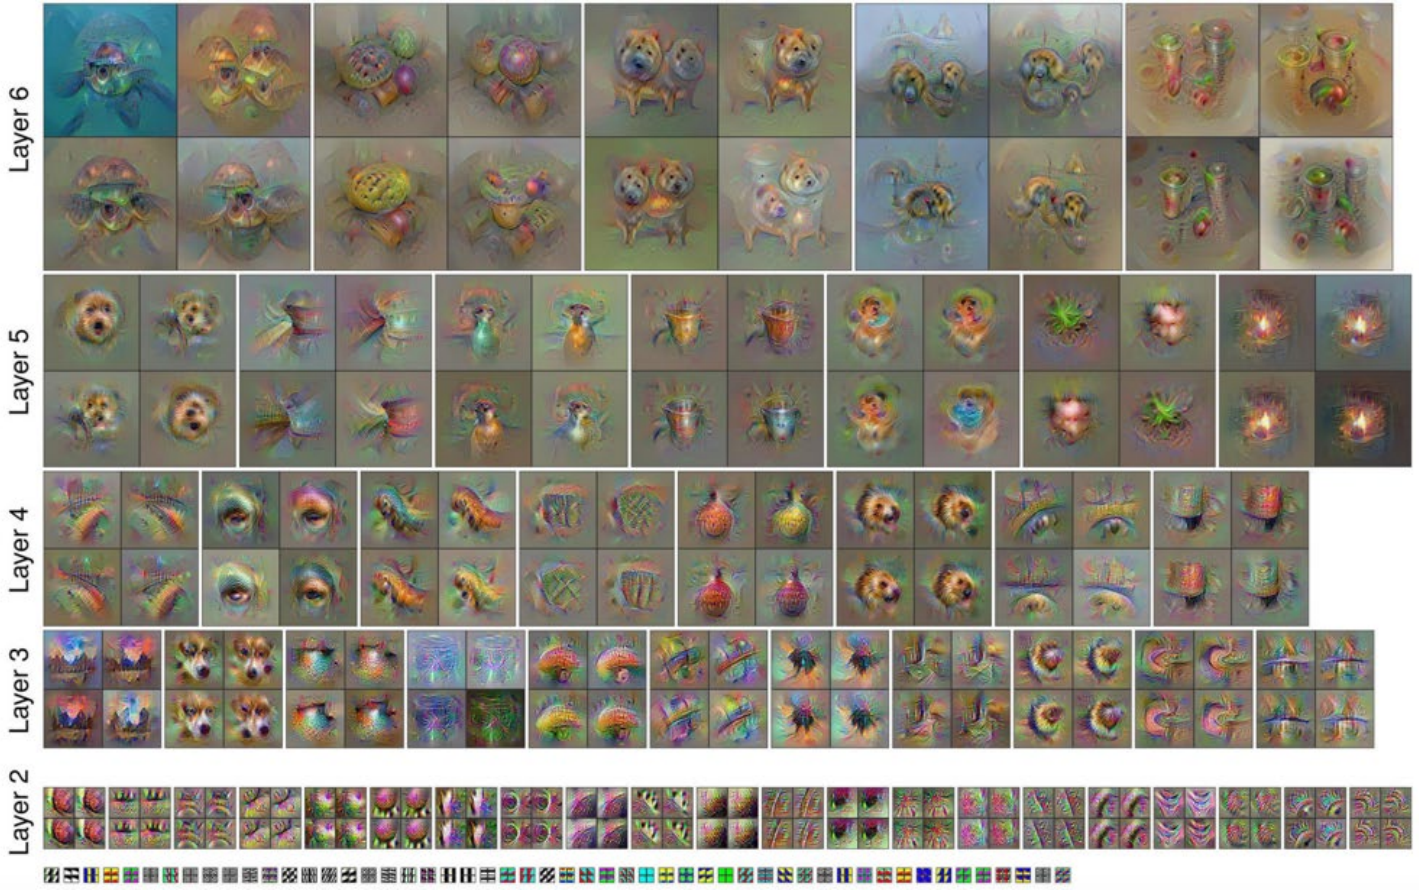
Reconstructions of multiple feature types (facets) recognized by the same “grocery store” neuron

Change initialization: project the training set images that maximally activate a neuron into a low-dimensional space (here, a 2D space via t-SNE), cluster the images via k-means, and average the n (here, 15) closest images to each cluster centroid to produce the initial image.

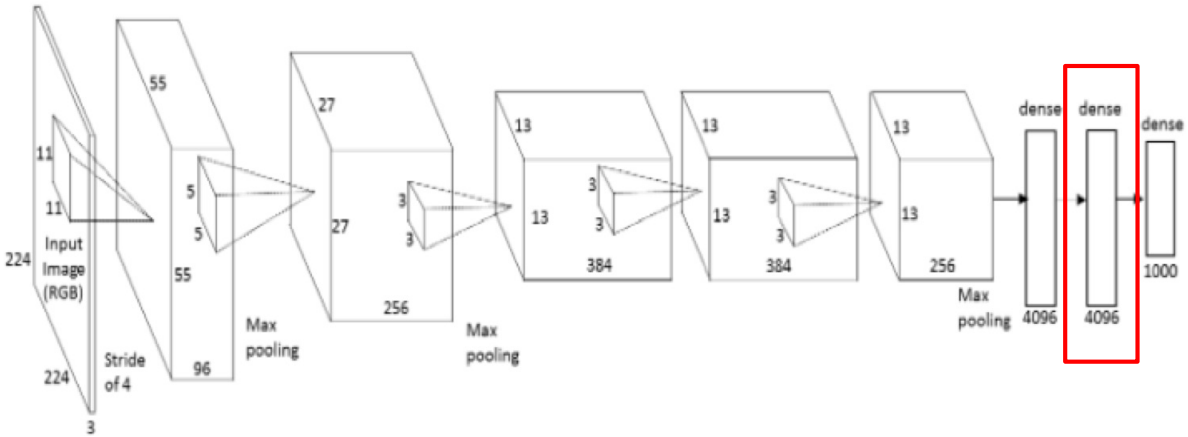
Improving Diversity

Nguyen et al 2016

[Multifaceted Feature Visualization: Uncovering the Different Types of Features Learned By Each Neuron in Deep Neural Networks]



Question: Given a CNN code, is it possible to reconstruct the original image?



Find an image such that:

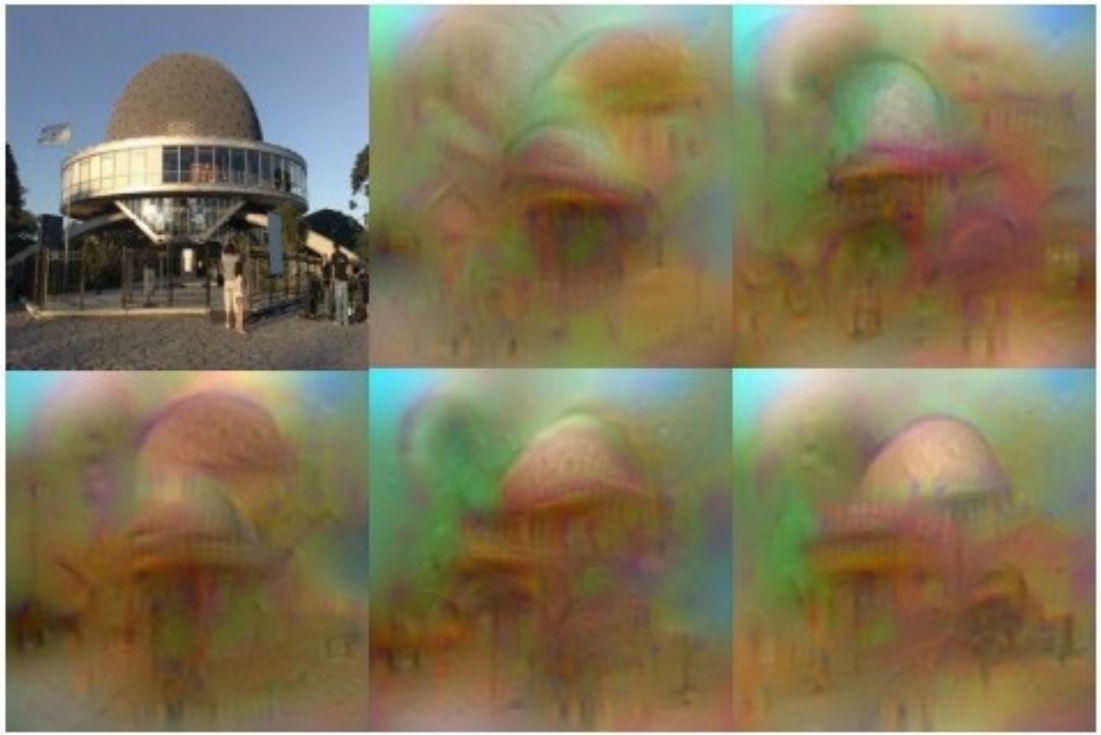
- Its code is similar to a given code
- It “looks natural” (image prior regularization)

$$\mathbf{x}^* = \underset{\mathbf{x} \in \mathbb{R}^{H \times W \times C}}{\operatorname{argmin}} \ell(\Phi(\mathbf{x}), \Phi_0) + \lambda \mathcal{R}(\mathbf{x})$$

$$\ell(\Phi(\mathbf{x}), \Phi_0) = \|\Phi(\mathbf{x}) - \Phi_0\|^2$$

Understanding Deep Image Representations by Inverting Them
[Mahendran and Vedaldi, 2014]

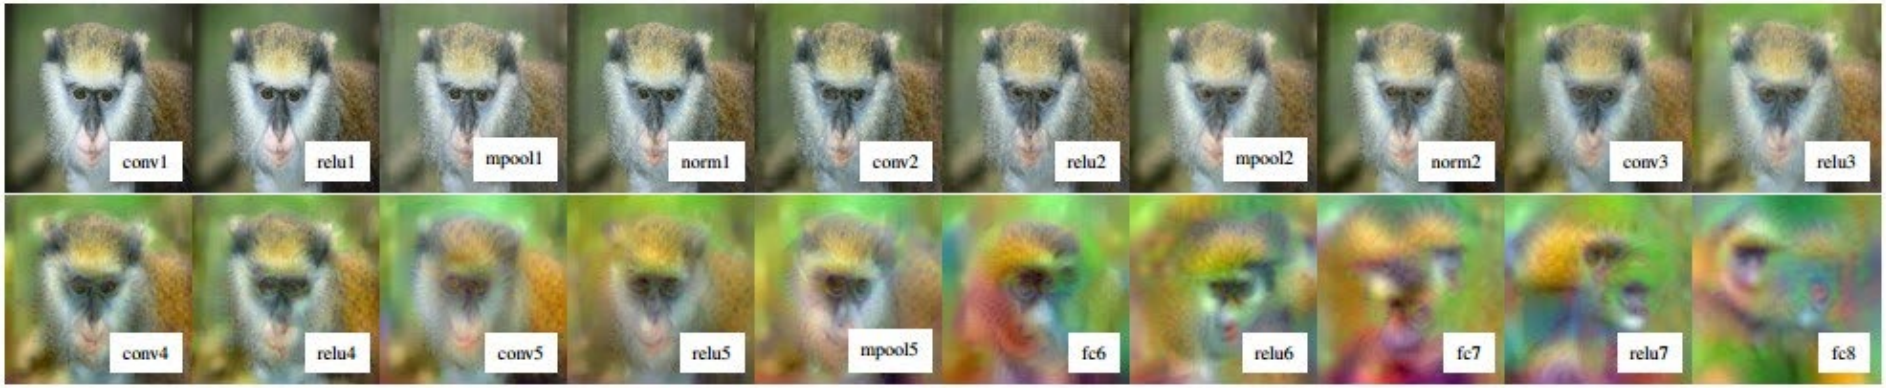
original image



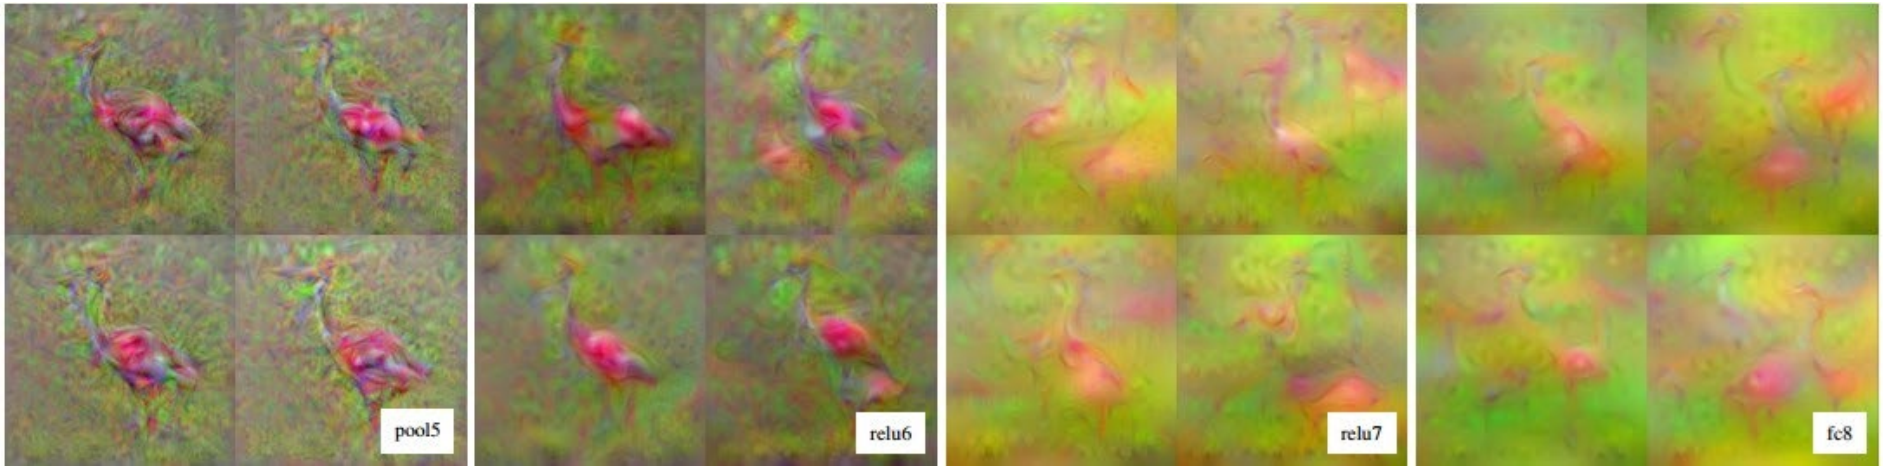
reconstructions from the 1000 log probabilities for ImageNet (ILSVRC) classes

Reconstructions from the representation after last last pooling layer (immediately before the first Fully Connected layer)

Reconstructions from intermediate layers



Multiple reconstructions. Images in quadrants all “look” the same to the CNN (same code)



Inverting Visual Representations with Convolutional Networks

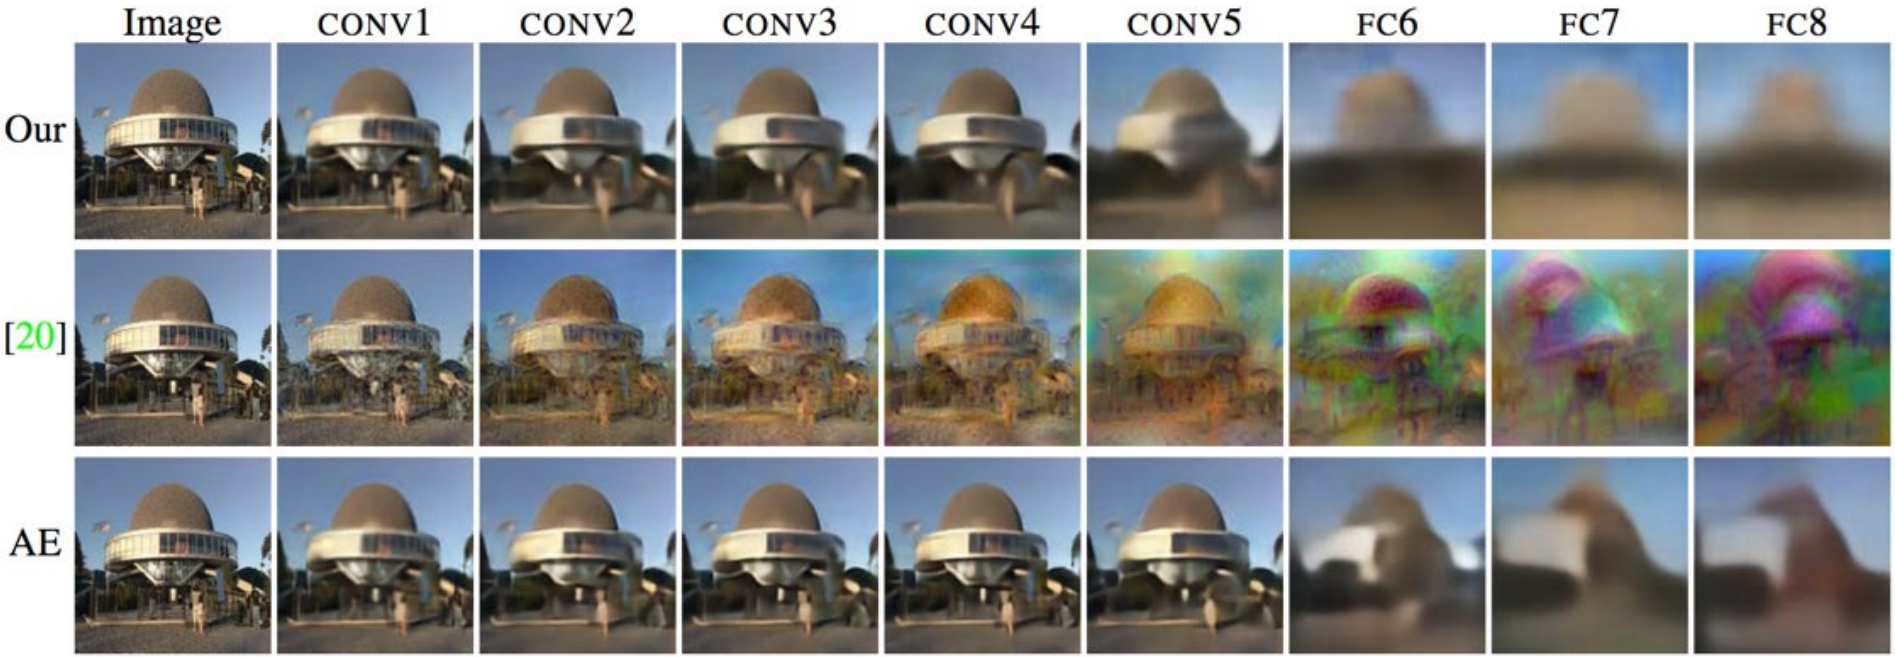
(Another **code inversion** approach from [Dosovitskiy and Brox 2015])

- Requires no optimization “at test time”, directly trains the image reconstructor with Euclidean loss to the original true image.

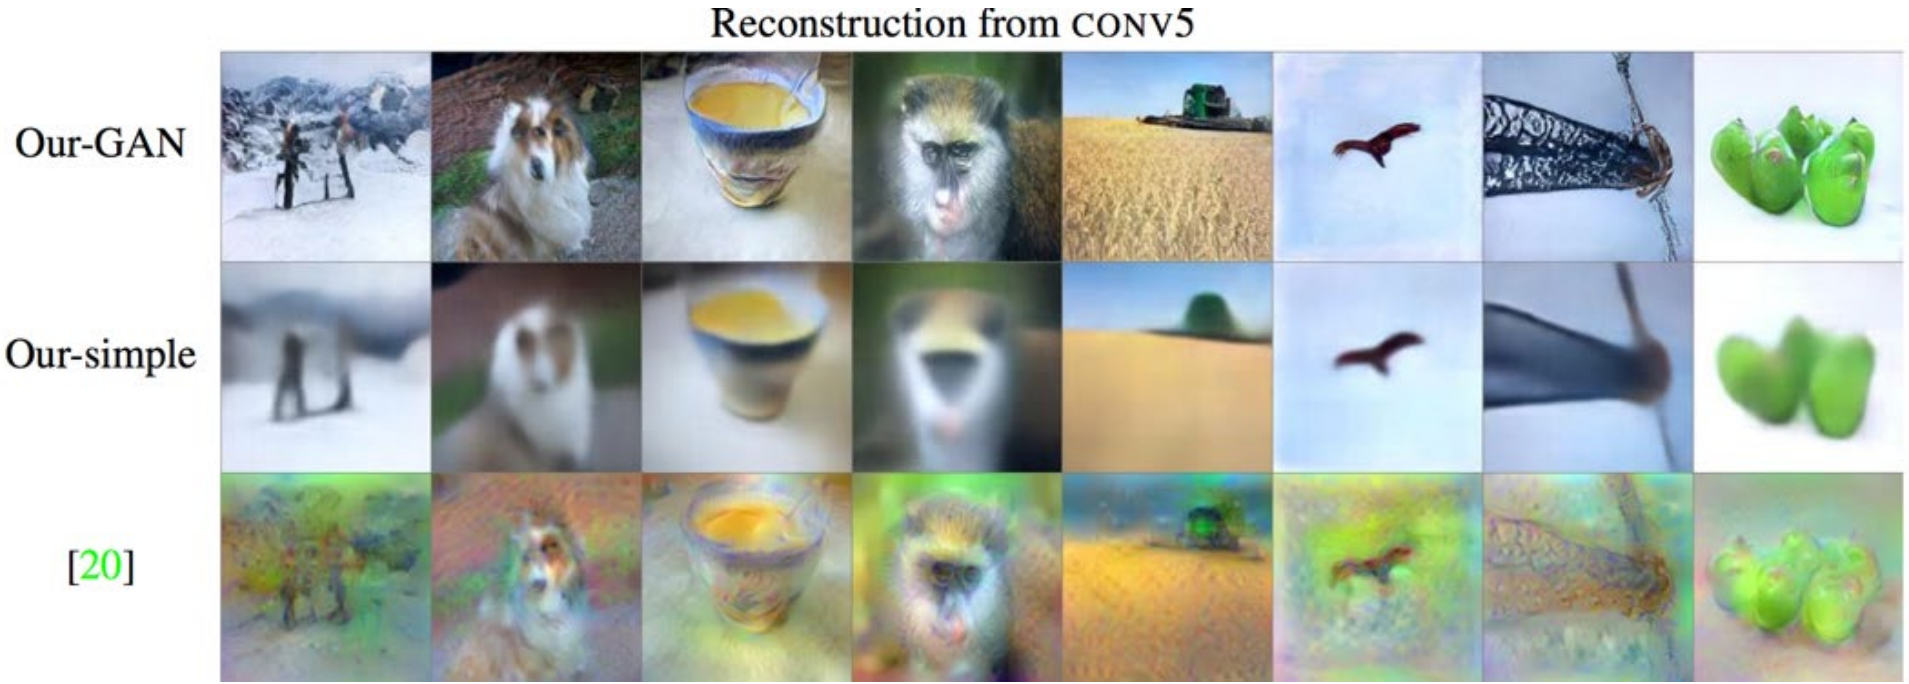
$$W^* = \arg\min_W \sum_i ||x_i - f(\Phi(x_i), W)||_2^2$$

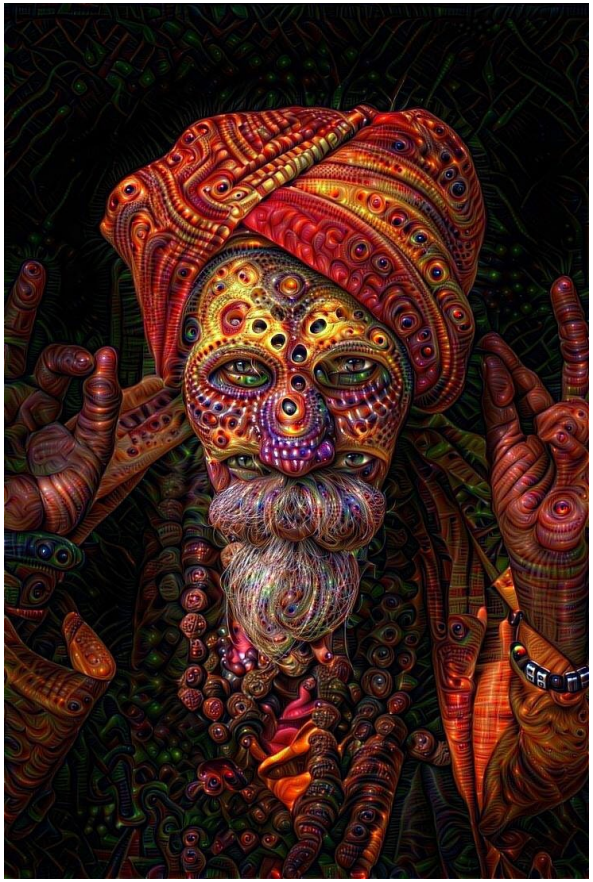
i.e. directly train a network for the mapping: features -> image.

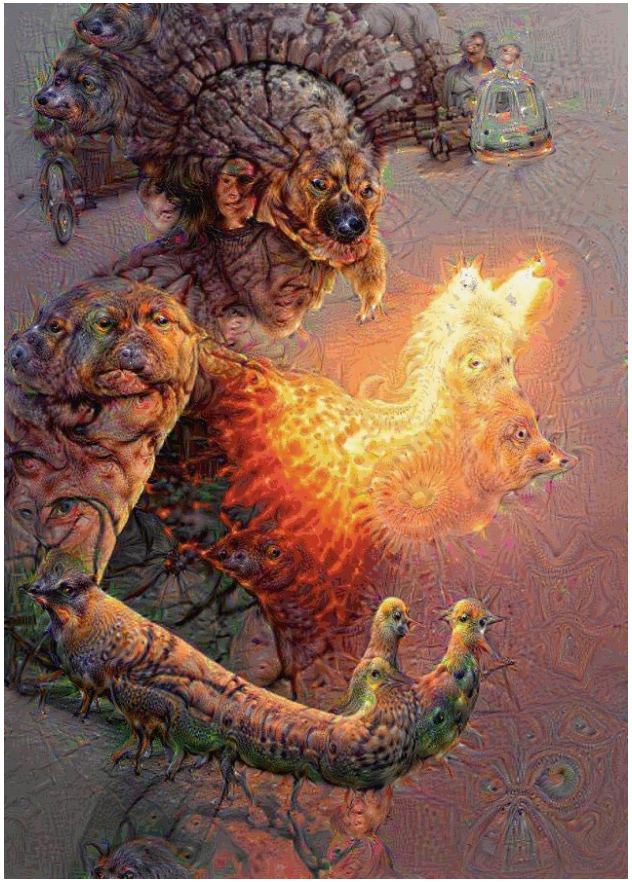
[Dosovitskiy and Brox 2015]



[Dosovitskiy and Brox 2015]







DeepDream https://github.com/google/deepdream

```python
def objective_L2(dst):
    dst.diff[:] = dst.data

def make_step(net, step_size=1.5, end='inception_4c/output',
              jitter=32, clip=True, objective=objective_L2):
    '''Basic gradient ascent step.'''

    src = net.blobs['data'] # input image is stored in Net's 'data' blob
    dst = net.blobs[end]

    ox, oy = np.random.randint(-jitter, jitter+1, 2)
    src.data[0] = np.roll(np.roll(src.data[0], ox, -1), oy, -2) # apply jitter shift

    net.forward(end=end)
    objective(dst)  # specify the optimization objective
    net.backward(start=end)
    g = src.diff[0]
    # apply normalized ascent step to the input image
    src.data[:] += step_size/np.abs(g).mean() * g

    src.data[0] = np.roll(np.roll(src.data[0], -ox, -1), -oy, -2) # unshift image

    if clip:
        bias = net.transformer.mean['data']
        src.data[:] = np.clip(src.data, -bias, 255-bias)
```

```
def objective_L2(dst):
    dst.diff[:] = dst.data

def make_step(net, step_size=1.5, end='inception_4c/output',
              jitter=32, clip=True, objective=objective_L2):
    '''Basic gradient ascent step.'''

    src = net.blobs['data'] # input image is stored in Net's 'data' blob
    dst = net.blobs[end]

    ox, oy = np.random.randint(-jitter, jitter+1, 2)
    src.data[0] = np.roll(np.roll(src.data[0], ox, -1), oy, -2) # apply jitter shift

    net.forward(end=end)
    objective(dst)  # specify the optimization objective
    net.backward(start=end)
    g = src.diff[0]
    # apply normalized ascent step to the input image
    src.data[:] += step_size/np.abs(g).mean() * g

    src.data[0] = np.roll(np.roll(src.data[0], -ox, -1), -oy, -2) # unshift image

    if clip:
        bias = net.transformer.mean['data']
        src.data[:] = np.clip(src.data, -bias, 255-bias)
```

DeepDream: set dx = x :)

jitter regularizer

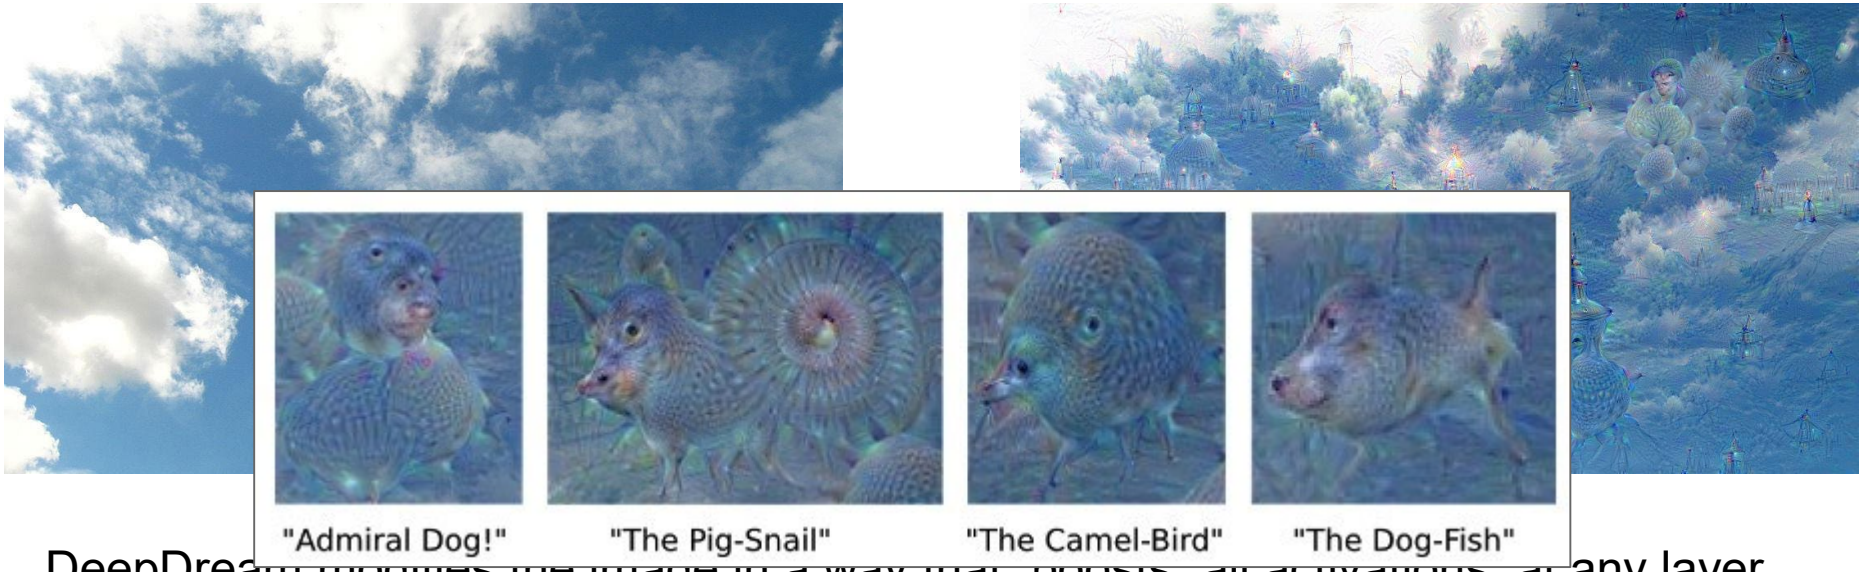
“image update”

inception_4c/output

DeepDream modifies the image in a way that “boosts” all activations, at any layer

this creates a feedback loop: e.g. any slightly detected dog face will be made more and more dog like over time

inception_4c/output



DeepDream modifies the image in a way that "boosts" all activations, at any layer

inception_3b/5x5_reduce

DeepDream modifies the image in a way that “boosts” all activations, at any layer

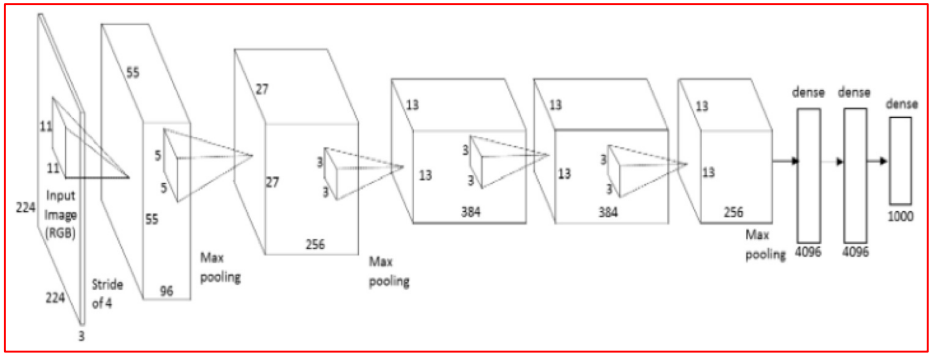
NeuralStyle

[A Neural Algorithm of Artistic Style by Leon A. Gatys, Alexander S. Ecker, and Matthias Bethge, 2015]
good implementation by Justin Johnson in Torch:
https://github.com/jcjohnson/neural-style

make your own easily on deepart.io

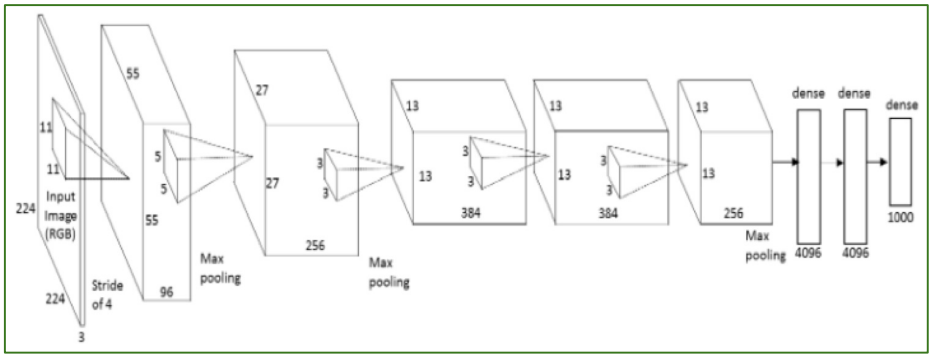
Step 1: Extract **content targets** (ConvNet activations of all layers for the given content image)



content activations

e.g.
at CONV5_1 layer we would have a [14x14x512] array of target activations

Step 2: Extract **style targets** (Gram matrices of ConvNet activations of all layers for the given style image)



style gram matrices $G = V^{\mathrm{T}}V$

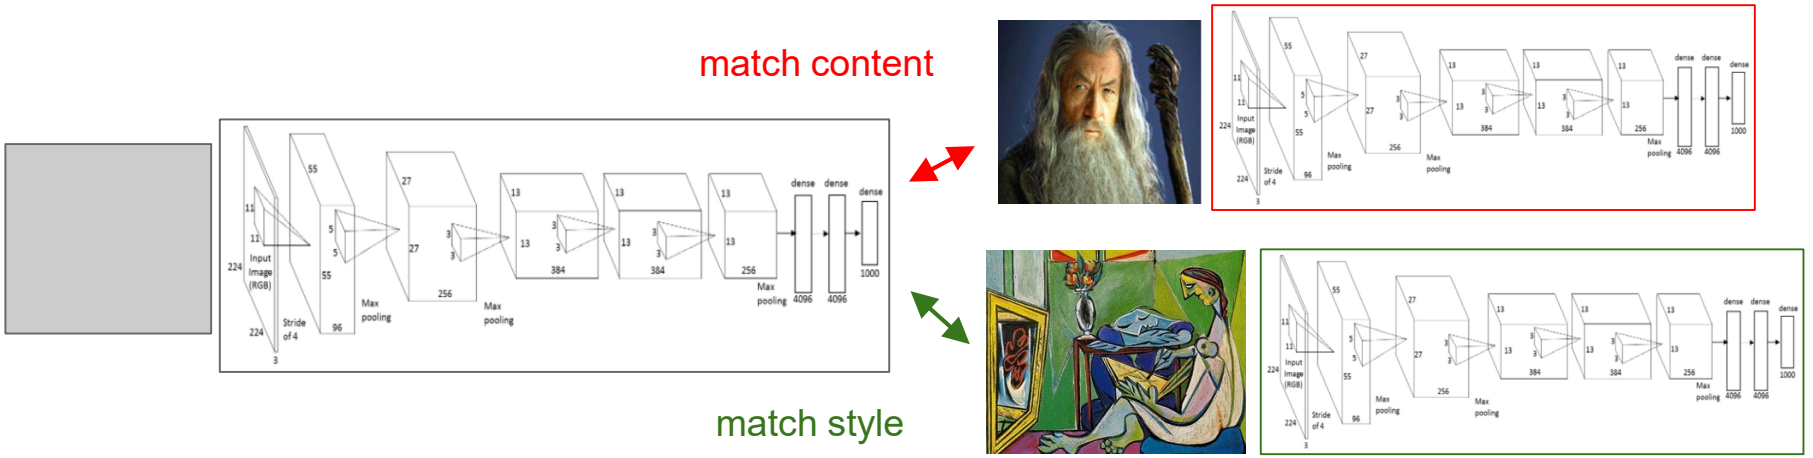
e.g.
at CONV1 layer (with [224x224x64] activations) would give a [64x64] Gram matrix of all pairwise activation covariances (summed across spatial locations)

Step 3: Optimize over image to have:

- The **content** of the content image (activations match content)
- The **style** of the style image (Gram matrices of activations match style)

$$\mathcal{L}_{total}(\vec{p}, \vec{a}, \vec{x}) = \alpha \mathcal{L}_{content}(\vec{p}, \vec{x}) + \beta \mathcal{L}_{style}(\vec{a}, \vec{x})$$

(+Total Variation regularization (maybe))



FAST neural-style

run a webcam demo in real time:

https://github.com/jcjohnson/fast-neural-style

Fast Neural Style

Recall for **image code inversion**:

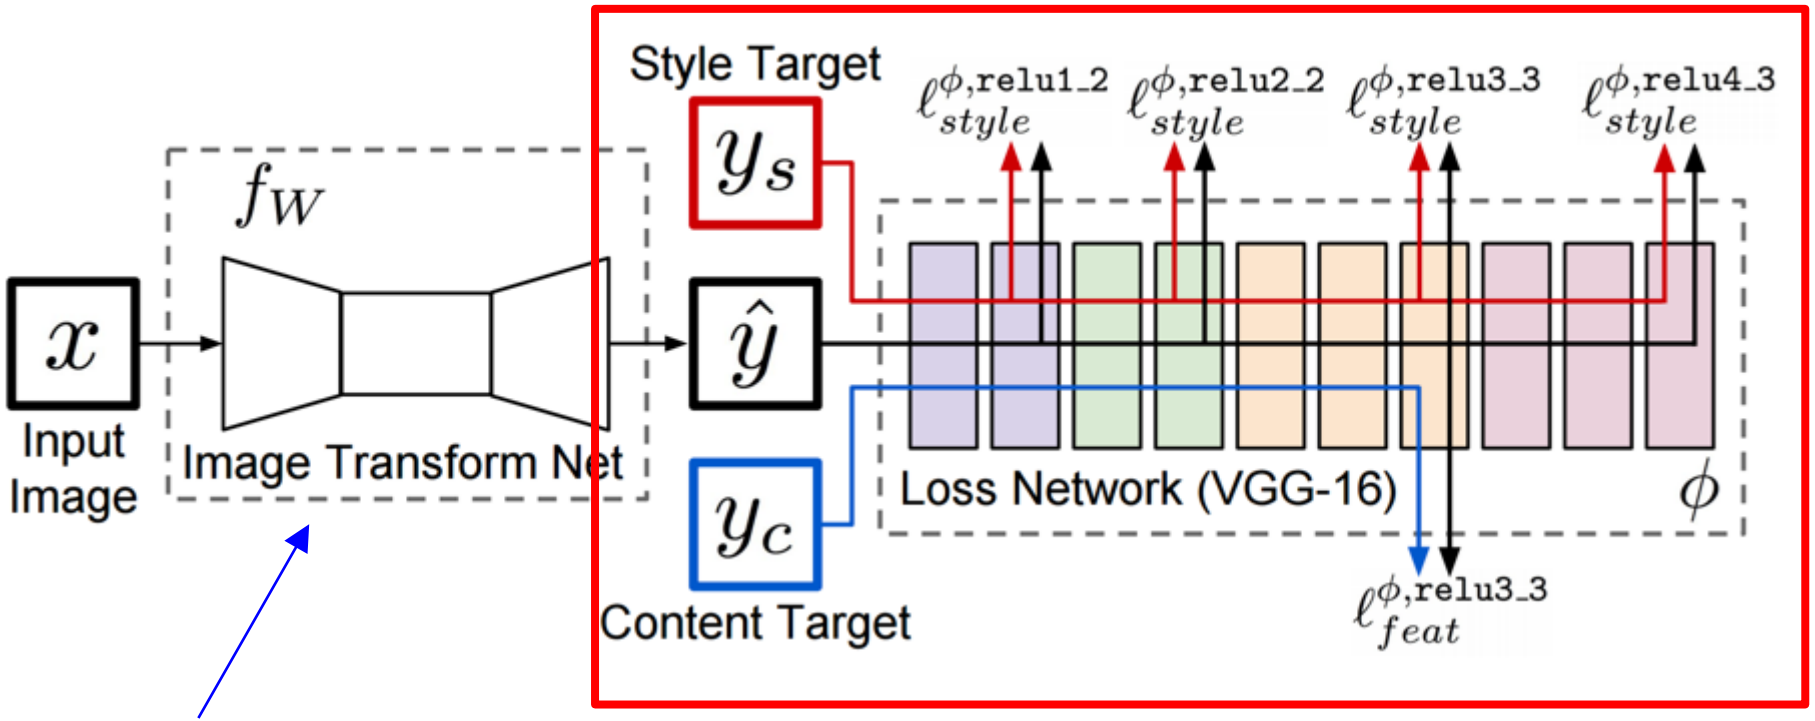
- Mahendran and Vedaldi 2014:
  optimize over the image such that the compute code matches a target code.
- Dosovitskiy and Brox 2015:
  train a new "inversion" network from code to image using image-image loss (e.g. L2)

Use the same idea to transform Neural Style to Fast Neural Style!

Fast Neural Style

Johnson et al. 2016

Can also think of this as a fixed discriminator in GAN that doesn't get trained...



Train this network

All of this is just "neural style loss"

Pros: SUPER FAST (no optimization); **Cons**: network is style-specific :(

Summary

Visualize representations (e.g. t-SNE), use activations as feature vectors

CNNs:

- Visualize weights – easy
- Network-Centric Visualization
- Optimize class score over the input – importance to regularize
- Image-Centric Visualization
- Much easier to interpret – “localizes” activations to a real image
- Deconv approaches - guided backprop, use more info when you have it
- Initialization matters ! Can get good images from good initializations
- Full layers (codes) contain much more information and allow better image reconstruction.

Summary

Deep Dream: Feed back activations as gradients: hallucinate

Optimization for class output can be used to create “fooling images”

Neural Style transfer:

- Learn a classifer
- Take outputs from a given layer to evaluate content (code)
- Computer gram matrices from that layer to evaluate style
- Optimize images to match code and gram matrix
